REPORTS ON PROGRESS IN PHYSICS

VOLUME 33, PART 1

1970

The nature of bonds in paper and the behaviour of paper under mechanical strain

C. T. J. DODSON

Department of Mathematics, Cartmel College, University of Lancaster

Contents

	Page
1. The material paper	2
2. The nature of bonds in paper	2
2.1. Introduction	2
2.2. The chemical nature of fibre-to-fibre bonds in paper	3
2.3. Observations on individual fibre-to-fibre bonds	6
2.4. Fibre bonding and paper structure	9
2.5. Summary	12
3. The behaviour of paper under mechanical strain	12
3.1. Introduction	12
3.2. The peculiar properties of paper	13
3.3. Conventional rheology	15
3.4. The molecular approach	17
3.5. Network theories	21
3.6. Statistical rheology and interaction	27
3.7. Rheochemistry	29
3.8. Fracture	33
3.9. Dimensional stability	38
3.10. Summary	40
Acknowledgments	41
References	41

The medical applications of ultrasonics

P. N. T. WELLS

University of Bristol and United Bristol Hospitals

Contents

	Page
1. Introduction	46
2. Fundamental physics	46
3. Transducers	48
3.1. Transducer materials	48
3.2. Transducer design	49
4. The ultrasonic field	51
4.1. Beam formation	51
4.2. Methods of measurement	53
5. Acoustic properties of biological tissues	57
5.1. Propagation velocity	57
5.2. Characteristic impedance	58
5.3. Absorption	59
6. Interactions of ultrasonic waves with biological tissues	60
6.1. Early investigations	60
6.2. Thermal effects	61
6.3. Mechanical effects	64
6.4. Other investigations	71
7. Surgical applications	74
7.1. Neurosurgery	74
7.2. Vestibular surgery	76
8. Therapeutic applications	78
8.1. Physiotherapy	78
8.2. Production of aerosols	79
9. Diagnostic applications	79
9.1. Pulse-echo techniques	80
9.2. Continuous-wave techniques	87
Acknowledgments	91
Appendix: glossary of biomedical terms	91
References	94

The kinetics of migration of point defects to dislocations

R. BULLOUGH[†] AND R. C. NEWMAN^{‡§}

[†] Atomic Energy Research Establishment, Harwell, Didcot, Berks.

[‡] J. J. Thomson Physical Laboratory, University of Reading

Contents

	Page
1. Introduction	102
2. The interactions between dislocations and point defects	104
2.1. The first-order size interaction	104
2.2. The second-order size interaction	108
2.3. The inhomogeneity interaction	111
2.4. Electrical interactions	115
2.5. Chemical interaction	116
2.6. Snoek ordering	116
2.7. The Girifalco–Wilsdorf interaction term	116
2.8. The total interaction with a dislocation	117
3. Diffusion of point defects in a dislocation field and pure drift flow solution	117
3.1. The drift model of Cottrell and Bilby	118
3.2. Drift to a dislocation in a radial potential field	120
3.3. Drift flow of defects with a size-effect interaction to a dislocation loop	121
3.4. Concluding remarks	122
4. The kinetics of growth of a Maxwellian atmosphere	123
5. Simple stress-field assisted precipitation solutions	128
6. Transient boundary conditions at the dislocation core	132
6.1. Effect of pressure changes on the diffusion process	133
6.2. Effect of saturating the dislocation stress field	135
6.3. Effects due to co-precipitation of vacancies	136
7. Migration of vacancies to dislocations	137
7.1. Straight dislocations	137
7.2. Dislocation loops	140
8. Experimental observations of dislocation climb during precipitation in silicon	143
9. Conclusions	146
References	146

Optical phonons of small crystals

R. RUPPIN^{††} AND R. ENGLMAN[§]

[†] Department of Physics, University of North Carolina, Chapel Hill, North Carolina, USA

[§] Soreq Nuclear Research Centre, Yavne, Israel

Contents

	Page
1. Introduction	150
2. Theory for polariton modes	153
2.1. The Helmholtz equations for the polariton modes.	153
2.2. Solutions of the polariton mode equations	155
2.3. The properties of the polariton modes.	158
2.4. An alternative choice of the boundary conditions	159
2.5. Optical properties	161
3. Theory for pure phonon modes	169
3.1. The equations for phonons in finite samples	169
3.2. Examples	173
3.3. Optical properties of small samples	176
3.4. Complex cubic crystals	177
3.5. Uniaxial crystals	178
4. Infrared absorption (experimental)	179
4.1. Experimental work on powdered samples	179
4.2. Experimental work on cylinders and slabs	189
5. Scattering studies	190
5.1. Raman scattering	190
5.2. Electron scattering	192
6. Related excitations	192
7. Conclusions	193
References	194

Optical applications of dielectric thin films

P. H. LISSBERGER

Department of Pure and Applied Physics, University of Salford,
Salford, Lancashire

Contents

	Page
1. Introduction	198
2. Basic theoretical framework	200
2.1. Amplitude reflectance at a single boundary between two massive media—Fresnel coefficients	208
2.2. Multilayer calculations	208
2.3. Amplitude reflectance and transmittance	209
2.4. The method of superposition	212
2.5. A reiterative method for the calculation of amplitude reflectance	214
2.6. Representation of absorption in layer materials	214
2.7. Intensity and energy relationships	215
2.8. The generalized Airy formula	218
2.9. The method of equivalent layers	219
3. Readily available materials	223
4. Applications	226
4.1. Antireflection coatings	226
4.2. Dielectric multilayer mirrors	231
4.3. Edge filters	236
4.4. Beam splitters	238
4.5. Narrow band interference filters	240
4.6. Magneto-optical applications	249
5. Performance and limitations of narrow band interference filters	251
5.1. Estimation of performance	251
5.2. Limitations	256
6. Problems in the preparation of optical coatings	259
6.1. Preparation of a layer of uniform thickness	260
6.2. Monitoring of optical thickness	262
7. Probable future developments	265
References	267

The afterglow and energy transfer mechanisms of active nitrogen

J. ANKETELL† AND R. W. NICHOLLS

Centre for Research in Experimental Space Science, York University, Toronto, Ontario, Canada

Contents

	Page
1. Introduction	270
2. Phenomena	270
2.1. The spectrum of the afterglow	271
2.2. The nature of the active species	273
2.3. Effect of pressure	274
2.4. Effect of temperature	275
2.5. Effect of additives	275
2.6. Surface-catalysed excitation of the afterglow	276
3. Review of excitation mechanisms	277
3.1. The B $^3\Pi_g$ state and emission of the first positive bands	278
3.2. The B' $^3\Sigma_u^-$ state and emission of the infrared afterglow bands	282
3.3. The a $^1\Pi_g$ state and emission of the Lyman-Birge-Hopfield bands	283
3.4. The a' $^1\Sigma_u^-$ state and emission of the Wilkinson-Mulliken ultraviolet bands	284
3.5. The A $^3\Sigma_u^+$ state and emission of the Vegard-Kaplan bands	284
3.6. The c $^3\Pi_u$ state and emission of the second positive bands	285
4. Proposed excitation kinetics of the nitrogen afterglow	286
4.1. Radiative lifetimes of emitting electronic states of N ₂	286
4.2. Simplified perturbation theory	287
4.3. Mechanism for populating B $^3\Pi_g$, $v = 12-9$	288
4.4. Mechanism for populating B $^3\Pi_g$, $v = 8-5$	291
4.5. Mechanism for populating B' $^3\Sigma_u^-$, $v = 8-5$	293
4.6. Mechanism for populating B $^3\Pi_g$, $v = 4-0$	294
4.7. Mechanism for populating a' $^1\Sigma_u^-$	297
4.8. Mechanism for populating a $^1\Pi_g$	298
4.9. The A $^3\Sigma_u^+$ state and the Vegard-Kaplan bands	299
4.10. Mechanism for populating c $^3\Pi_u$	300
4.11. Pressure dependence of the relative intensities of the visible, ultraviolet and infrared emissions	302
4.12. The $^5\Sigma_g^+$ state	302
5. Summary	303
Acknowledgments	304
References	304

Dislocations and stacking faults

J. W. CHRISTIAN AND V. VÍTEK

Department of Metallurgy, University of Oxford

Contents

	Page
1. Geometrical properties of dislocations	308
1.1. Introduction	308
1.2. Burgers vector and Burgers circuit	309
1.3. Stacking faults and partial dislocations	311
1.4. Dislocation motion and dislocation sources	315
2. The continuum theory of dislocations	318
2.1. Introduction	318
2.2. Volterra dislocations	320
2.3. Forces on dislocations	324
2.4. Image forces	326
2.5. Dislocation dipoles and dislocation pile-ups	327
2.6. Line tension	330
2.7. Interactions of dislocations with point defects	331
2.8. Continuous distribution of dislocations	334
2.9. The effects of elastic anisotropy	338
3. Dislocations in crystal lattices	340
3.1. The Frenkel–Kontorova and Peierls–Nabarro models	340
3.2. Dissociation models	343
3.3. Atomic models	344
3.4. The Peierls barrier or lattice friction stress	348
4. Dislocation dynamics	351
4.1. Undamped dislocation motion	351
4.2. Damping by energy dissipation	354
5. Dislocations in common structures	359
5.1. Stability criteria	359
5.2. Face-centred cubic structures	360
5.3. Hexagonal close-packed structures	372
5.4. Body-centred cubic structures	376
5.5. The diamond structure	378
5.6. Ionic crystals	381
5.7. Superlattice structures	382
6. Thermally activated dislocation motion	384
6.1. Thermodynamic analysis	384
6.2. Discrete obstacles	388
6.3. Changes in dislocation configuration	390
7. Interface dislocations	393
7.1. Coherent interfaces: twinning and transformation dislocations	393
7.2. Dislocation models of interfaces	397
7.3. Glide of dislocations across a coherent interface	399
