PREFACE	v
I. Introduction	1
II. Transport Equations	3
1. Phenomenological Equations for General Case of Anisotropic Solids	3
2. Inversion of Fundamental Transport Equations	7
3. Application to Isotropic Solids	10
4. Physical Significance of Transport Coefficients	12
a. One-Dimensional Case, Absence of Magnetic Field	13
b. Isotropic Case, Transverse Magnetic Field, Absence of Thermal Gradients	15
III. Expressions for Charge-Carrier Transport Coefficients	18
5. General Theory — The Boltzmann Equation	18
6. Use of a Relaxation Time in the Boltzmann Equation	23
a. Quadratic Energy Surfaces	24
b. Nonquadratic Energy Surfaces	27
7. Expressions for Transport Coefficients in Isotropic Solids	32
a. Conductivity Coefficients	32
b. Phenomenological Expression for Current Density Vector	35
8. Transport Coefficients in Anisotropic Isothermal Solids	36
a. Conductivity Tensors	36
b. Resistivity Tensors	41
c. Application of Phenomenological Relations to Various Crystal Systems	43
(1) General Systems	43
(2) Cubic Groups O_h , O , or T_d (systems of point group symmetry $m\bar{3}m$, 432 , $\bar{4}3m$)	44
(3) System of Point-Group Symmetry $3m$ or $\bar{3}m$ (Trigonal System C_{3v} or D_{3d})	46
(4) Orthorhombic System (Group D_{2h})	48
IV. Experimental Determination of Transport Coefficients in Isothermal Media	50
9. Measurements on Isotropic Materials	50

a. Discussion of Transverse Magnetoresistance and Hall Effects	52
b. Experimental Determinations of Hall Coefficient and Magnetoresistance	54
(1) Effect of Transverse Current on Hall Voltage . .	56
(2) Effect of Transverse Currents on Magnetoresistance	58
(3) Nongeometrical Causes of Transverse Currents .	59
(4) Temperature Gradients	66
10. Other "Hall" and Magnetoresistance Phenomena . . .	68
a. Various Hall Phenomena	68
(1) Quadratic "Hall" Effect	68
(2) Less Conventional "Hall" Phenomena	69
(3) Concerning the Definitions of the Hall Effect . .	70
b. Corbino Magnetoresistance, Magnetoconductivity . .	71
11. Measurements on Anisotropic Materials	76
a. Weak-Magnetic-Field Region	77
(1) Diamond Cubic Symmetry	77
(2) Other Crystal Systems	79
b. Magnetic Fields of Arbitrary Intensity	82
(1) General Discussion of Parameters of Interest . .	82
(2) Hall Phenomena	84
(3) Magnetoresistance Phenomena	86
(4) Illustrative Examples	88
V. Transport Coefficients for Isothermal Solids Assuming a Single Parabolic Energy Band and the Relaxation Time Approximation	92
12. General Considerations — Exact Statistics	92
a. Expressions for Conductivity Coefficients	92
b. Limiting Cases of Weak and of Strong Magnetic Fields	95
c. Conductivity Mobility	98
d. Hall Coefficient, Hall Mobility, and Magnetoresistance	99
e. Arbitrary Magnetic Field Strengths	105
13. Commonly Encountered Scattering Mechanisms — Exact Statistics	107
a. Scattering by Thermal Lattice Vibrations	107
b. Scattering by Ionized Impurities	111
c. Mixed Scattering	116
14. Conductivity Coefficients in the Limit of Extreme Degeneracy	120
15. Conductivity Coefficients in the Limit of Classical Statistics	123

a. Limiting Cases of Weak and of Strong Magnetic Fields	124
(1) General Power Law Scattering	124
(2) Acoustic Phonon Scattering	124
(3) Ionized Impurity Scattering	125
(4) Charge Carrier Interactions	128
(5) Mixed Scattering	130
b. Conductivity, Hall, and Magnetoresistance Mobilities	139
c. General Case of Arbitrary Magnetic Field Strengths	142
(1) Power-Law Scattering	143
(2) Mixed Scattering	145
VI. Multiband Conduction	148
16. General Considerations	148
17. Parabolic Conduction and Valence Bands	152
a. Two-Band Case	153
b. Three-Band Conduction	163
c. Extrinsic <i>p</i> -type Germanium and Similar Semiconductors	167
VII. Nonquadratic Energy Surfaces	175
18. General Considerations	175
19. Valence Bands of Germanium and Silicon	177
20. Weak-Field Transport Coefficients	181
a. Conductivity and Hall Effect	181
b. Magnetoconductivity and Magnetoresistance	185
21. Arbitrary Magnetic Field Strengths	189
a. General Considerations	189
b. Cubic Energy Surfaces	193
c. Other Energy Surfaces	194
d. Application to Germanium and Silicon	195
e. Structure in Hall Coefficient Curves of Other Materials	212
VIII. Quadratic Energy Surfaces of the Many-Valley Type	213
22. General Discussion	213
a. Case of Isotropic Scattering on a Surface of Constant Energy	213
b. Anisotropic Scattering	220
23. Application to Specific Semiconductors	223
a. Weak Magnetic Fields	224
(1) Single Spheroid with Principal Axes along Coordinate Directions	224

(2) Systems of Spheroids Possessing Cubic Symmetry, Coordinate Axes along Cube Axes	226
(3) System of Ellipsoids Possessing Cubic Symmetry	239
b. Arbitrary Magnetic Field Strengths	242
(1) Constant Mean Free Path	242
(2) Scattering Processes Other Than $\tau \sim \varepsilon^{-1/2}$	251
c. Noncubic Crystals	254
IX. Special Bands and Scattering Processes	267
24. Nonparabolic Bands and Nonequivalent Valleys	267
a. Nonparabolic Bands and Nonequivalent Valleys, with Special Consideration of III-V Compound Semicon- ductors	267
b. Structurally-Equivalent Valleys Rendered Nonequiv- alent by Perturbations	277
25. Inapplicability of the Relaxation Time Approximation	278
a. General Discussion — Use of Variational Technique	278
b. Application to Semiconductors	282
(1) General Considerations	282
(2) Criteria for Applicability of Relaxation time Concept	283
(3) Application of the Variational method to Polar Semiconductors	289
c. The Variational Principle in the Presence of a Magnetic Field	296
26. General Treatment of Conductivity in Anisotropic Metals	301
X. Miscellaneous Items	308
27. Inhomogeneities	308
a. Random Inhomogeneities in Measurement Sample	308
b. Gross Inhomogeneities in Measurement Sample	312
(1) Continuous Variations in Conductivity	312
(2) The Step-Function Model	318
c. Experimental Data	321
d. Inhomogeneities in Magnetic Field	323
e. Techniques for Reducing Distortion due to Inhomogene- ities	325
f. Non-Ohmic Effects in Inhomogeneous Specimens	326
28. Quantum-Mechanical Transport Theory, Strong Magnetic Field Effects	328
a. General Discussion	328
b. Determination of Transport Coefficients	334
c. Data on Strong-Field Magnetoresistance in Semicon- ductors	337

d. Other Strong-Magnetic-Field Effects — Depopulation Phenomena	340
29. Adiabatic and Isothermal Phenomena	344
30. More General Treatments of Scattering	354
a. Electron-Phonon Interactions in Nonpolar Semiconductors with a Complex Band Structure	355
b. Combined Phonon and Impurity Scattering	360
c. Multiphonon Processes	361
d. Other Investigations of Scattering	362
31. Strong Interactions	365
a. Discussion of Strong Scattering	365
b. Impurity Conduction	367
c. Hopping Processes — "Narrow-Band" Semiconductors	372
d. Polarons	378
32. Miscellaneous	379
a. Non-Ohmic Effects in a Solid	379
(1) Charge-Carrier Multiplication	380
(2) Field-Dependent Mobilities, "Hot Electrons"	386
(3) Field-Dependent Recombination Rates	390
b. Photon Effects, PEM Phenomena	391
AUTHOR INDEX	395
SUBJECT INDEX	406

Tables

TABLE I. Values of the Function $K'(\beta, 0)$	135
TABLE II. Values of Band Structure Parameters for Heavy- and Light-Mass Valence Bands (V_2 and V_3 , Respectively) for Germanium and Silicon	184
TABLE III. Values of Parameters Determining the Conductivity Coefficients for Several Types of Energy Surfaces	198
TABLE IV. Low-Field Magnetoconductivity Components for Cubic Crystals with Axially Symmetric Valleys, Referred to the Crystal Axes	222
TABLE V. Equivalence of Symbols Used in This Article and Those of Abeles-Meiboom and Shibuya	225
TABLE VI. Values of Anisotropy Factors for Conductivity Coefficients in Case of Single Spheroid	227
