CONTENTS

CONTRIBUTORS ix
FOREWORD xi

Part I. History and Application of General Circulation Models

The Beginnings of Numerical Weather Prediction and General Circulation Modeling: Early Recollections

JOSEPH SMAGORINSKY

1. Introductory Remarks 3
2. Some Personal Antecedents 4
3. The Institute for Advanced Study 1949–1953 5
4. The Road to Operational Adaptation of Numerical Weather Prediction 18
5. The Advent of the General Circulation Modeling Era 25
6. Epilogue 36

Carbon Dioxide and Climatic Change

SYUKURO MANABE

1. Introduction 39
2. Historical Background 40
3. Radiative, Convective Equilibrium 42
4. Distribution of the Global Climate Change 48
5. Transient Response 72
6. Concluding Remarks 77
References 80

Part II. Statistical-Dynamical Models

Almost Empirical Approaches to the Problem of Climate, Its Variations and Fluctuations

G. S. GOLITSYN

1. Introduction 85
2. Determination of Mean Climate Characteristics 87
3. Sensitivity of Climate to Variations of External Factors 89
4. Empirical Estimates of Feedback between Albedo and Temperature of Underlying Surface 93
5. Empirical Estimates of the Role of Clouds in Radiation Balance 96

6. Sensitivity of Climate to Changes of Atmospheric CO_2 Content 100
7. Statistical Properties of Climatic System 103
8. Conclusion 110
Appendix 111
References 112

Parameterization of Traveling Weather Systems in a Simple Model of Large-Scale Atmospheric Flow

G. J. Shutts

1. Introduction 117
2. Dynamics of Monthly Mean Climatology 119
3. Parameterization: How and Why 130
4. Transfer Theory of Geostrophic Turbulence 133
5. A Highly Parameterized Climate Model 144
6. Conclusion 167
References 169

Climatic Systems Analysis

Barry Saltzman

1. Introduction 173
2. General Theoretical Considerations and Equations: The Basis for Climate Modeling 176
3. Time Constants and Integral Constraints 183
4. A Prototype Deterministic System 195
5. Climate as a Stochastic-Dynamical System: Effects of Random Forcing 203
6. Concluding Remarks 210
Appendix A. A Resolution of Climatic Variability 213
Appendix B. Time Constants and Conditions for Equilibration 215
Appendix C. A Generalized SDM Governing Long-Term Changes of the Complete Climatic System 218
References 230

Part III. Radiative, Surficial, and Dynamical Properties of the Earth–Atmosphere System

Satellite Radiation Observations and Climate Theory

George Ohring and Arnold Gruber

1. Introduction 237
2. The Earth's Radiation Budget 239

3. Sensitivity Studies 263
4. Validation of Climate Models 288
5. Climatology from Satellites 296
References 302

Land Surface Processes and Climate—Surface Albedos and Energy Balance

ROBERT E. DICKINSON

1. Introduction 305
2. Surface Albedos 308
3. Surface Energy Balance 334
4. Further Remarks on Land Surface Processes as a Component of Climate Models 350
References 352

Global Angular Momentum and Energy Balance Requirements from Observations

ABRAHAM H. OORT AND JOSÉ P. PEIXÓTO

1. Introduction 355
2. Data Handling and Analysis Procedures 360
3. Angular Momentum Balance of the Climatic System 361
4. Energy Balance of the Climatic System 386
5. Some Implications for the Global Energy Cycle of the Climatic System 431
6. Concluding Remarks 443
Appendix A. Tables 447
Appendix B. The Mean Meridional Circulation 479
List of Symbols and Definitions 484
References 486

INDEX 491

CARBON DIOXIDE AND CLIMATIC CHANGE

SYUKURO MANABE

Geophysical Fluid Dynamics Laboratory/NOAA
Princeton University
Princeton, New Jersey

1. Introduction 39
2. Historical Background 40
3. Radiative, Convective Equilibrium 42
   3.1. Approach toward Thermal Equilibrium 43
   3.2. Equilibrium Response 45
4. Distribution of the Global Climate Change 48
   4.1. General Circulation Model 49
   4.2. Simulated Climate 50
   4.3. Design of Sensitivity Experiment 54
   4.4. Thermal Response 54
   4.5. Hydrologic Response 63
   4.6 Signal-to-Noise Ratio 68
5. Transient Response 72
   5.1. Coupled Ocean–Atmosphere Model 72
   5.2. Design of Switch-On Experiment 74
   5.3. Temporal Variation 74
6. Concluding Remarks 77
   References 80

PARAMETERIZATION OF TRAVELING WEATHER SYSTEMS IN A SIMPLE MODEL OF LARGE-SCALE ATMOSPHERIC FLOW

G. J. SHUTTS[1]

Atmospheric Physics Group
Department of Physics
Imperial College of Science and Technology
London, United Kingdom

1. Introduction 117
2. Dynamics of Monthly Mean Climatology 119
   2.1 The Zonal-Mean Climate 120
   2.2 Longitudinal Variations of Climate: Quasi-Geostrophic Theories 121
   2.3 Interpretation of Observations 128
3. Parameterization: How and Why 130
4. Transfer Theory of Geostrophic Turbulence 133
   4.1 A Brief Review 133
   4.2 Parameterization of Zonal-Mean Eddy Heat and Vorticity Fluxes 135
   4.3 Parameterization of Local Time-Mean Eddy Heat and Vorticity Fluxes 140
5. A Highly Parameterized Climate Model 144
   5.1 Model Description 145
   5.2 Model Parameterization 150
   5.3 Experiments and Results 154
   5.4 Remarks on Further Experiments 165
6. Conclusion 167
   References 169

CLIMATIC SYSTEMS ANALYSIS

BARRY SALTZMAN

Department of Geology and Geophysics
Yale University
New Haven, Connecticut

1. Introduction 173
2. General Theoretical Considerations and Equations: The Basis for Climate Modeling 176
3. Time Constants and Integral Constraints 183
   3.1. Equilibration Times for the Different Climatic Domains 184
   3.2. Some Integral Constraints on Mass and Energy 189
   3.3. Climate Equilibrium of the Atmosphere and Surface of the Earth 191
4. A Prototype Deterministic System 195
   4.1. The "Reference" Deterministic Solution 196
   4.2. Sensitivity of the Equilibria to Changes in Parameters: Prediction of the Second Kind . 197
   4.3. Structural Stability 201
5. Climate as a Stochastic-Dynamical System: Effects of Random Forcing 203
   5.1. The Stochastic Amplitude 209
   5.2. Structural Stochastic Stability 209
6. Concluding Remarks 210
   Appendix A. A Resolution of Climatic Variability 213
   Appendix B. Time Constants and Conditions for Equilibration 215
   Appendix C. A Generalized SDM Governing Long-Term Changes of the Complete Climatic System 218
   C.1. Preliminary Considerations and Modeling Approximations 218
   C.2. Ice-Mass Equation 222
   C.3. Mean Ocean Temperature Equation 225
   C.4. Vertical Heat Flux at Surface 225
   C.5. Net Radiative Flux at Top of Atmosphere 227
   C.6. Complete Deterministic System 228
   References 230

SATELLITE RADIATION OBSERVATIONS AND CLIMATE THEORY

GEORGE OHRING[1]

Department of Geophysics and Planetary Sciences
Tel-Aviv University, Tel-Aviv, Israel
and
National Earth Satellite Service, NOAA
Washington, D.C.

AND

ARNOLD GRUBER

Earth Sciences Laboratory
National Earth Satellite Service, NOAA
Washington, D.C.

1. Introduction 237
2. The Earth's Radiation Budget 239
   2.1. Introduction 239
   2.2. Time and Space Average Radiation Budget 241
   2.3. Intercomparison of Satellite Radiation Budget Observations 253
   2.4. Additional Remarks 262
3. Sensitivity Studies 263
   3.1. Introduction 263
   3.2. Longwave Radiation and Surface Temperature 264
   3.3. The Radiation Budget and Cloud Amount 271
   3.4. Absorbed Solar Radiation and Surface Temperature 284
4. Validation of Climate Models 288
   4.1. Introduction 288
   4.2. Description of the Model 289
   4.3. Validation 290
   4.4. Summary 295
5. Climatology from Satellites 296
   5.1. Introduction 296
   5.2. Annual Cycle of Energy Budget at Top of Atmosphere for Selected Climatic Regions 296
   References 302

LAND SURFACE PROCESSES AND CLIMATE—SURFACE ALBEDOS AND ENERGY BALANCE

ROBERT E. DICKINSON

National Center for Atmospheric Research[1]
Boulder, Colorado

1. Introduction 305
2. Surface Albedos 308
   2.1. Incoming Solar Flux 308
   2.2. Important Factors When Considering Surface Albedos 311
   2.3. Mathematical Theory of Plant Canopy Albedos 313
   2.4. Summary of Parameters Determining Plant Canopy Albedos 321
   2.5. Snow Albedos 324
   2.6. Soil Albedos 329
   2.7. Surface Albedos for Climate Models 333
3. Surface Energy Balance 334
   3.1. Uniform Single Surface with No Heat Storage and Saturated Air 337
   3.2. Thermal Capacity of Soil and Snow Surfaces 339
   3.3. Nonsaturated Air over Bare Ground 341
   3.4. Evapotranspiration from Vegetative Cover 344
   3.5. Temperature of a Nontranspiring Canopy 346
   3.6. Modeling the Temperature of a Transpiring Canopy 348
   3.7. Modeling Energy Exchange over a Snow Surface 349
4. Further Remarks on Land Surface Processes as a Component of Climate Models 350
   References 352

GLOBAL ANGULAR MOMENTUM AND ENERGY BALANCE REQUIREMENTS FROM OBSERVATIONS

ABRAHAM H. OORT

Geophysical Fluid Dynamics Laboratory/NOAA
Princeton University
Princeton, New Jersey

AND

JOSÉ P. PEIXÓTO

Geophysical Institute
University of Lisbon
Lisbon, Portugal

1. Introduction 355
2. Data Handling and Analysis Procedures 360
3. Angular Momentum Balance of the Climatic System 361
   3.1. Description of the Basic Circulation 363
   3.2. Meridional Transport of Angular Momentum 371
   3.3. Vertical Transport of Angular Momentum 376
   3.4. Angular Momentum Transfer between Earth and Atmosphere 381
4. Energy Balance of the Climatic System 386
   4.1. Radiational Forcing 386
   4.2. Description of the Energy in the Atmosphere 394
   4.3. Poleward Transport of Energy 404
   4.4. Vertical Transport of Energy 421
   4.5. Fulfillment of the Energy Balance 425
5. Some Implications for the Global Energy Cycle of the Climatic System 431
   5.1. Equations 431
   5.2. Spatial Distribution of Energy 434
   5.3. Spatial Distribution of Energy Conversions 436
   5.4. Energy Cycle 437
6. Concluding Remarks 443
   Appendix A. Tables 447
   Appendix B. The Mean Meridional Circulation 479
   B.1. Extratropics 479
   B.2. Surface Boundary Layer 480
   B.3. Tropics 481
   B.4. Final Comments 481
   List of Symbols and Definitions 484
   References 486
