FOREWORD	vii
PREFACE	ix
<b>1. Introduction</b>	
1.1. Historical Development	1
1.2. Overview and Scope	9
<b>2. Instrumentation Systems</b>	
2.1. General Considerations	15
2.2. The USGS Central California Microearthquake Network	23
2.3. Other Land-Based Microearthquake Systems	39
2.4. Ocean-Based Microearthquake Systems	41
<b>3. Data Processing Procedures</b>	
3.1. Nature of Data Processing	46
3.2. Record Keeping	49
3.3. Event Detection	50
3.4. Event Processing	60
3.5. Computing Hypocenter Parameters	70
<b>4. Seismic Ray Tracing for Minimum Time Path</b>	
4.1. Elastic Wave Propagation in Homogeneous and Heterogeneous Media	76
4.2. Derivation of the Ray Equation	78
4.3. Numerical Solutions of the Ray Equation	82
4.4. Computing Travel Time, Derivatives, and Take-Off Angle	89

**5. Generalized Inversion and Nonlinear Optimization**

5.1. Mathematical Treatment of Linear Systems	106
5.2. Physical Consideration of Inverse Problems	115
5.3. Computational Aspects of Solving Inverse Problems	116
5.4. Nonlinear Optimization	122

**6. Methods of Data Analysis**

6.1. Determination of Origin Time and Hypocenter	130
6.2. Fault-Plane Solution	139
6.3. Simultaneous Inversion for Hypocenter Parameters and Velocity Structure	148
6.4. Estimation of Earthquake Magnitude	153
6.5. Quantification of Earthquakes	158

**7. General Applications**

7.1. Permanent Networks for Basic Research	164
7.2. Temporary Networks for Reconnaissance Surveys	165
7.3. Aftershock Studies	166
7.4. Induced Seismicity Studies	166
7.5. Geothermal Exploration	168
7.6. Crustal and Mantle Structure	168
7.7. Other Applications	170

**8. Applications for Earthquake Prediction**

8.1. Seismicity Patterns	199
8.2. Temporal Variations of Seismic Velocity	208
8.3. Temporal Variations of Other Seismic Parameters	215

**9. Discussion**

Text	223
