FOREWORD xi

PREFACE xiii

1. Introduction

1.1 Imaging With Sound Waves	1
1.2 Acoustic Lens versus Electronic Processing	4
1.3 Survey of Applications	16

2. Image Generation by Linear Transformations

2.1 Transformation in the Medium and Inverse Transformation by Tapped Delay Circuits	18
2.2 Inverse Transformation by Means of The Fourier Transform	27
2.3 Inverse Transformation by Means of Sampled Storage Circuits	33

3. Implementation of the Fourier Transform and Beam Formers by Analog Circuits

3.1 Fast Fourier Transform Circuit with 16 Input Terminals	41
3.2 Fast Fourier Transform Circuits with 32 and 64 Input Terminals	48
3.3 Fast Fourier Transform Circuits for $2^k 3^m 5^n \dots$ Samples	78
3.4 Passive Beam Forming with Fourier Transform Circuits	82
3.5 The Inverse Fourier Transform	84
3.6 Active Beam Forming with Inverse Fourier Transform Circuits	91

* Equations are numbered consecutively within each of Sections 1.1 to 9.5. Reference to an equation in a different section is made by writing the number of the section in front of the number of the equation, e.g., Eq. (2.2-9) for Eq. (9) in Section 2.2.

Illustrations and tables are numbered consecutively within each section, with the number of the section given first, e.g., Fig. 5.4-2, Table 3.1-1.

References are characterized by the name of the (first) author, the year of publication, and a lower cased latin letter if more than one reference by the same (first) author is listed for the year.

4. Focusing for Spherical Wavefronts

4.1	Theoretical Foundations	95
4.2	Computer Plots of Diffraction Patterns	106
4.3	Focusing Circuits	111

5. Practical Equipment

5.1	Principles of Array Design	123
5.2	Circuit Architecture	133
5.3	Time Filters for Noise Rejection	136
5.4	Image Display and Test Results	142

6. Multiplexing and Sidelobe Reduction

6.1	Multiplexing Hydrophone Array and Processor	147
6.2	Increased Dynamic Range by Sidelobe Reduction	154
6.3	Circuits for Sidelobe Reduction	158

7. Implementation of Imaging by Digital Circuits

7.1	Digital Delay Circuits	162
7.2	Digital Circuits for the Fourier Transform	163
7.3	Synchronous Demodulation as the Key to Practical Circuits	165

8. Special Effects Producing by Electronic Circuits

8.1	Range Images and Three-Dimensional Images	169
8.2	Doppler Images	172
8.3	Telelens Effect	173
8.4	Pseudocolor Images	174
8.5	Spread Spectrum Insonification	177

9. Synthetic Aperture Processing

9.1	Transmission of Power and Information by Sinusoidal Waves	179
9.2	Introduction to Synthetic Aperture Theory	182
9.3	One- and Two-Dimensional Synthetic Apertures	193
9.4	Image Contrast, Pulse Compression	202
9.5	Resolution	206
