<i>Foreword: The Historical Context</i>	Arthur I. Miller	9
<i>A Note from the Editor</i>	Thomas Braun	22
<i>Acknowledgments</i>		25
<i>1. Introduction</i>		26
<p>Personal conviction is fundamental in theories of philosopher-scientists, 28 / Discussions on border problems of science and philosophy with Einstein, von Laue, and Planck reflect their attitude as theoreticians always in contact with experimental science, 29 / Importance of verification and/or verifiability, 29 / Truth values of theories, 30 / Essential role of mathematics in physics, 30</p>		
<i>2. The Universal Constants of Nature</i>		32
<p>What do the universal constants tell us about reality? Are they "true"? 32 / Einstein responds (11 May 1945): His hints of a logically-based theory of physics contain the words "rational as π and e," 33 / This prompts another question, 34 / Einstein replies with a detailed exposition of what would have to be presupposed before the suggested mathematical approach could prove successful (13 October 1945), 36 / The author discusses Einstein's "radical postulate," 38 / Einstein's opinion of his own conjectures (23 April 1949), 40 / Einstein agrees with author's views on universal constants (24 March 1950), 41 / von Laue writes of his accordance with Planck's belief in "something Absolute" (16 September 1948), 46 / Would faith in the lawfulness of nature be shattered if the universal constants were independent of each other? Laue replies (3 May 1949), 48 / Laue writes of his current work in revising his books on relativity (20 February 1950), 50 / Author discusses Einstein's "true" constants, 53 / Laue comments on younger physicists (27 December 1951), 54 / Planck comments on constants (30 March 1947), 57</p>		

3. *The Concepts of Substance and Conservation* 58

Historical outline, 58 / Laue deplores loss of concept of individuality (28 December 1954), 61 / Author offers explanation, 61 / Einstein (4 July 1931), and Planck (28 October 1931), agree with author's views on unity in a world picture, 64

4. *Physical Reality* 67

Profound difference of opinion on concept of reality between Niels Bohr and strict determinists, Einstein, Laue, and Planck, 67 / Einstein hopes to solve quantum puzzle without having to renounce the representation of the "real" (31 March 1944), 70 / and has confidence in his approach to problem of "unity of forces" (9 April 1946), 72 / Laue rejects "observer" in relativity theory (6 March 1953), 72 / Criteria for accepting a scientific theory, 75 / Role of mathematics in physics, 75

5. *The Smallest Length* 78

Heisenberg proposes the hodon, 78 / Laue discusses difficulties with the "smallest length" (5 November 1952), 79 / and (6 March 1953), 79 / Einstein considers the hodon to be a "lame compromise" between point mechanics and field theory (6 January 1953), 82

6. *More on Their Philosophies and Personalities* 83

Einstein, von Laue, and Planck shared Kant's view of philosophy as the basis for all science, 83 / Einstein looks forward to author's treatise on Kant's space-time problem in relation to relativity theory (5 January 1920), 84 / Studied by his friend Goedel (3 February 1947), 86 / Laue throws light on Einstein's outlook and his own (30 July 1955), 94 / Personal qualities and views of the three great scientists, 94 / Einstein, Laue, and Planck deeply concerned about future of German science during Nazi barbarities, 106 / This concern reflected in Planck's letter (6 January 1939), 108 / Einstein's touching last message to author (5 April 1954), 113

Appendix: On Eddington's Philosophy of Physical Science
