

Contents

FOREWORD	xi
I. GLIMPSES OF THE HISTORY OF MATHEMATICS	1
1. The first numbers	1
2. The continuation of the sequence of numbers	3
3. The infinite	4
4. The irrational	6
5. The infinitely small	8
6. The evolution of the calculus	11
7. Some later developments	13
II. NUMBER SYSTEMS	18
1. The natural numbers	18
2. The integers	19
3. The rational numbers	20
4. The real numbers	21
5. Complex numbers	28
III. LINEAR ALGEBRA	33
1. Vectors, vector space	33
2. Dependence, dimension, basis	35
3. Subspace	36
4. The scalar product	37
5. Linear transformation, matrix	38
6. Multiplication of linear transformations	41
7. Multiplication of matrices	42
8. Row matrices, column matrices	44
9. Rank of a matrix	46
10. Determinants	46
11. Solution of a non-homogeneous system of equations	48
12. Solution of a homogeneous system of equations	50
13. Latent roots	51
14. Latent roots and characteristic vectors of symmetric (real) matrices	53
15. Transformation of the main axes of symmetric matrices	56
IV. ANALYTICAL GEOMETRY	59
1. Coordinates	59
2. The geometry of the plane and of the straight line	62
3. Homogeneous coordinates	67
4. Circle and sphere	72

5. Conic sections	77
6. Curves of the second degree	83
7. Polar theory for conic sections	85
8. Surfaces of the second degree	88
9. Investigation of surfaces of the second degree	91
10. Polar theory of quadratic surfaces	94
V. ANALYSIS	96
DIFFERENTIAL AND INTEGRAL CALCULUS	96
1. The concept of function – Interval – Neighbourhood	96
2. The concept of limit	98
3. Algebra of limits	100
4. The concept of continuity	102
5. Theorem on continuous functions – Examples of continuous functions	103
6. Derivative	103
7. First derivative – Continuity and differentiability – Higher derivatives	105
8. Algebra of derivatives	107
9. The concept of arc length of a circle – Continuity of the trigonometric functions – Trigonometric inequalities	108
10. The derivatives of the trigonometric functions	111
11. Limit properties of composite functions	112
12. Differentiation of a composite function – The chain rule	113
13. Rolle's theorem and the mean value theorem of differential calculus	115
14. Generalized mean value theorem	118
15. Extreme values	119
16. Points of inflection	122
17. Primitive functions	124
18. Change of variables – Differentials – Integration by parts	124
19. The concept of area	126
20. Fundamental theorem of integral calculus	128
21. Properties of definite integrals	130
22. Method of integration by parts and method of substitution	132
23. Mean value theorem	133
24. Logarithmic function	133
25. Inverse function	136
26. The exponential function	137
27. The general power and the general exponential function	139
28. Some logarithmic and exponential limits	140
29. The general logarithm	142
30. The cyclometric functions	142
31. Leibniz's formula	145
32. The hyperbolic functions	146
33. The primitives of a rational function – Partial fractions	147
34. The primitives of $\cos^n x$ and $\sin^n x$ (n is an integer)	151
35. The primitives of a rational function of $\sin x$ and $\cos x$	153
36. The primitives of irrational algebraic functions	154
37. Improper integrals	157
FUNCTIONS OF TWO VARIABLES – PARTIAL DIFFERENTIATION	159
38. The concept of function	159
39. The concept of limit	160
40. Continuity	161
41. Partial differentiation	162

42. Partial derivatives of the second order	164
43. Composite functions – Total differential	165
44. Change of the independent variables	167
45. Functions of more than two variables	168
46. Extreme values of functions of two variables	168
47. Taylor's formula for a function of two variables – The mean value theorem	169
48. Sufficient conditions for extreme values of functions of two variables	171
MULTIPLE INTEGRALS	174
49. The concept of content—Double integral	174
50. Properties of integrals	175
51. Repeated integrals with constant limits	176
52. Extension to more general regions of integration	177
53. General curvilinear coordinates	179
54. Transformation of double integrals	180
55. Cylindrical coordinates	183
56. Triple integral	184
57. Spherical coordinates	186
58. Area of a plain region in polar coordinates	187
59. Volume of solids of revolution	188
60. Area of a curved surface in rectangular coordinates	190
61. Area of a curved surface in cylindrical and spherical coordinates	191
62. Area of surfaces of revolution	192
63. Mass and density of surfaces and solids	193
64. Static moment, centre of mass, moment of inertia	195
VI. SEQUENCES AND SERIES	201
1. Sequence of numbers	201
2. Convergence	201
3. Divergence	204
4. Evaluation of limits	204
5. Monotonic sequences	207
6. Cauchy's convergence theorem	208
7. Series	209
8. Uniform convergence	224
9. The Fourier series	228
VII. THEORY OF FUNCTIONS	237
1. Complex numbers	237
2. Functions	244
3. Integration theorems	250
4. Infinite series	260
5. Singular points	273
6. Conformal mapping	290
7. Infinite products	301
VIII. ORDINARY DIFFERENTIAL EQUATIONS	306
1. Introductory	306
2. Differential equations of the first order	307
3. Linear differential equations of the first order	308

4. Some remarks about the theory	313
5. Linear differential equations of higher order	317
6. Linear homogeneous equations with constant coefficients	322
7. Non-homogeneous differential equations	328
8. Non-linear differential equations	335
9. Coupled or simultaneous differential equations	342
 IX. SPECIAL FUNCTIONS	 351
1. Gamma-function and beta-function	351
2. Ordinary differential equations of the second order with variable coefficients	355
3. Hypergeometric functions	365
4. Legendre functions	378
5. Bessel functions	387
6. Spherical harmonics	409
 X. VECTOR ANALYSIS	 415
VECTORS IN SPACE	415
1. Vectors in three-dimensional space	415
2. Applications to differential geometry	420
THEORY OF VECTOR FIELDS	438
3. The differential operator ∇	438
4. Integral theorems	448
POTENTIALS OF MASS DISTRIBUTIONS	456
5. Poles and dipoles	456
6. Line and surface distributions	458
7. Volume distributions	463
DYADS AND TENSORS	465
8. Dyads	465
9. The deformation tensor	466
10. Gauss's theorem for dyads	467
11. The stress tensor	468
 XI. PARTIAL DIFFERENTIAL EQUATIONS	 470
1. Equations of the first order	470
2. The system of quasi-linear hyperbolic equations of the second order	478
3. Linear equations with constant coefficients	487
4. Approximation methods for elliptic differential equations	514
 XII. NUMERICAL ANALYSIS	 524
1. Introduction	524
2. Interpolation	532
3. Numerical integration of differential equations	567
4. The determination of roots of equations	578
5. Computations in linear systems	592

6. More on the approximation of functions by polynomials	609
7. Numerical integration of partial differential equations	614
8. Algol 60	624
 XIII. THE LAPLACE TRANSFORM	 634
1. Theory of the Laplace transform	634
2. Applications of the Laplace transform	661
3. Fourier transforms	689
4. Tables	691
5. Addendum	694
 XIV. PROBABILITY AND STATISTICS	 696
1. Introduction	696
2. Fundamental concepts and axioms of probability theory	697
3. Probability distributions	703
4. Mathematical expectation and moments	721
5. Characteristic functions and limit theorems	733
6. The normal distribution	739
7. Theory of estimation	745
8. The theory of testing hypotheses	752
9. Confidence limits	764
10. Theory of linear hypotheses	769
11. Subjects which have not been treated	772
 REFERENCES	 773
INDEX	777
OTHER TITLES IN THE SERIES	773
