Preface	ix
1 Introduction	
1.1 Approximation with understanding as its goal	1
1.2 Trial function approximation	3
1.3 The qualitative sketch	5
1.4 Standard functions	6
1.5 Useful accuracy	9
1.6 Scope and aims of the book	10
2 Mathematical preliminaries	
2.1 Conventions and abbreviations	12
2.2 Definition of terms used to describe ordinary differential equations	13
2.3 Exact solutions of simple linear first-order ordinary differential equations	14
2.4 Exact solutions of simple linear second-order ordinary differential equations	16
2.5 Damped linear oscillations	18
2.6 Free oscillations	19
2.7 Inherent oscillations	21
2.8 Approximations based on smallness	22
Problems	25
3 Estimation of time constants by exponential trial functions	
3.1 Introduction	29
3.2 Exponential rise and exponential decay	29
3.3 The falling stone problem	31
3.4 Collocation	37
3.5 The bimolecular reaction	38
3.6 Checking the trial function hypothesis*	41
3.7 Estimation of completion times*	43
Problems	45

4	Estimation of length constants by exponential trial functions	
4.1	Introduction	49
4.2	The length constant of a long cooling fin	49
4.3	The length constant of a filament lamp: the effect of symmetry	52
4.4	Long-range problems	57
	Problems	58
5	Parabolic trial functions	
5.1	Introduction	61
5.2	The short fuse	63
5.3	Collocation of parabolic trial functions	67
5.4	The short cooling fin	68
5.5	The period of a large-angle pendulum	70
	Problems	74
6	The QSTF method for unforced oscillations	
6.1	Realistic oscillator equations	78
6.2	Cosine trial functions	79
6.3	Nonlinear restoring term: the small-angle pendulum	80
6.4	Residual minimisation by harmonic balance	83
6.5	Asymmetric restoring term: atomic vibrations	84
6.6	Nonlinear damping: maintained oscillations of a van der Pol oscillator	86
6.7	The minimum residual and the residual ratio test*	87
	Problems	90
7	Forced oscillation and resonance	
7.1	Introduction	97
7.2	The QSTF method for forced oscillations	99
7.3	Primary resonance of a weakly nonlinear oscillator: the Duffing equation	101
7.4	Nonlinear resonance	103
	Problems	106
8	Exact solution of partial differential equations	
8.1	Introduction	110
8.2.	Separation of wave equations: the vibrating string	111
8.3	Spatial eigenfunctions and eigenvalues for a vibrating string	113
8.4	Normal modes of a vibrating string	114
8.5	Exact solutions of diffusion equations by separation	116
8.6	Decay modes	118

9	Estimation of lowest eigenvalues by parabolic trial functions	
9.1	Lowest-eigenvalue problems	120
9.2	Estimation of the lowest eigenvalue of a vibrating string	121
9.3	Parabolic trial functions as approximate eigenfunctions	123
9.4	The tidal periods in lakes	125
9.5	The fluorescent tube: mathematical model	128
9.6	Singularities at fictitious boundaries	130
9.7	Maintaining voltage of a fluorescent tube	132
9.8	The nonlinear positive column discharge	135
9.9	Buckling of a vertical column	137
	Problems	141
10	The QSTF method for conduction and diffusion equations	
10.1	Introduction	148
10.2	Development of laminar flow in a pipe	148
10.3	Doping of a semiconductor	152
10.4	Freezing of peas	156
	Problems	159
11	Extending the QSTF method	
11.1	Unfamiliar equations	165
11.2	The current gain of a junction transistor	166
11.3	The range of a high-energy particle	169
11.4	The Schrödinger equation for the harmonic oscillator	172
11.5	The crucial role of the qualitative sketch	176
11.6	Epilogue	177
	References	178
	Appendix 1 Selected functions	179
	Appendix 2 Series	187
	Appendix 3 Dedimensionalisation and reduction of parameters	189
	Appendix 4 Solution of algebraic equations	193
	Appendix 5 Coordinate systems, Laplacian operator and important partial differential equations	199
	Appendix 6 Trigonometric relations and Fourier series	202
	Answers	205
	Index	216
