

# Contents

## 1 Linear Equations: An Introduction to Matrices and Determinants

1. Vector Addition	1
2. Examples of Linear Algebraic Equations	3
3. The Matrix Concept	7
4. The Permutation Symbol	13
5. Determinants	15
6. Linear Dependence and Independence	22
7. The Rank of a Matrix	23
8. Consistency of Linear Algebraic Equations	24
9. A Linear Mechanical System	28
10. The Inverse of a Matrix	30

## 2 Vectors and Tensors in a Cartesian Space

1. Vector Spaces	34
2. Orthogonal Transformations	35
3. Differentiation of Vectors	39
4. The Dot Product	41
5. Solid Angle and Gauss' Law	47
6. Tensors	51
7. Isotropic Tensors	55
8. The Cross Product	58
9. Angular Momentum and Rigid Body Motion	63
10. The Eigenvalue Problem	71

## 3 Vector Fields

1. The Gravitational Field of a Point Mass	78
--	----

2. The Gradient of a Scalar Function	80
3. Review of Some Topics From Calculus	82
4. Gradient and Directional Derivative	83
5. The Divergence of a Vector	86
6. Heat Conduction and Diffusion	90
7. Line Integrals	93
8. Circulation and Curl	98
9. Differential and Integral Vector Identities	104
10. Electrostatics	108
11. Magnetostatics	114
12. Maxwell's Equations	120

## 4 Curvilinear Coordinates

1. Rectangular, Cylindrical, and Spherical Coordinates	127
2. Electric Dipoles	132
3. Admissible Coordinate Transformations and Jacobians	134
4. Vectors and Tensors	139
5. Differential Geometry	143
6. Basis Vectors and Reciprocal Basis Vectors	145
7. Dot and Cross Products	147
8. The Gradient Operator	149
9. Velocity and Acceleration	152
10. Divergence, Curl, and Laplacian	157
11. Magnetic Dipoles	159
12. Spheroidal Coordinates	161
13. Lagrange's Equations	167
14. Linear Vibrations	174

15. Euler Angles and Rigid Body Dynamics	181	2. Vibrating String	345
<b>5 Complex Numbers and Variables</b>		3. Vibrating Membrane	356
1. The Group Concept	188	4. Electromagnetic Waves in Metallic Conductors	362
2. Number Fields	191	5. Electromagnetic Waves in Hollow Conductors	367
3. The Complex Number Field	193	6. The Schrödinger Wave Equation	374
4. Review of Infinite Series	196	7. Potential Barrier	380
5. Infinite Series of Functions	204	8. Particle in a Box	384
6. Projectile Motion	214	9. One-Dimensional Waves in Elastic Media	388
7. Analytic Functions	216	10. The Sturm–Liouville Eigenvalue Problem	391
8. Complex Infinite Series	219	11. Hilbert Spaces and Unitary Spaces	398
9. The Exponential Function	223	12. Hermitian and Unitary Matrices	402
10. Diffraction Grating	225	13. The Heisenberg Uncertainty Relation	410
11. Capacitance and Inductance	229	14. The Cayley–Hamilton Theorem	412
12. Second-Order Linear Differential Equations	233	15. Spectral Theorem	416
13. Linear Driven Systems	239		
14. Trigonometric and Hyperbolic Functions	246		
15. Logarithms and Exponents	249		
16. Inverse Functions	255		
17. Two-Dimensional Potential Problems	259		
18. Integration in the Complex Plane	267		
19. Taylor and Laurent Expansions	272		
20. Improper Integrals	279		
21. Applications of the Residue Theorem	284		
22. Gamma and Beta Functions	291		
23. Asymptotic Series	296		
<b>6 Probability, Statistics, and Experimental Errors</b>			
1. The Probability Concept	303	1. Definition and Convergence of Fourier Series	425
2. The Binomial Distribution	307	2. Examples of Fourier Series	430
3. Poisson and Normal Distributions	312	3. Periodic Solutions of Nonlinear Differential Equations	437
4. Maximum Likelihood	317	4. Classical Central Force Problem	444
5. Method of Least Squares	322	5. The Fourier Integral	450
6. Lagrange Multipliers	326	6. The Free Particle in Quantum Mechanics	455
7. Maxwell–Boltzmann Statistics	329	7. Solution of the Wave Equation	459
<b>7 Introduction to Hilbert Space and Eigenvalue Problems</b>		8. The Laplace Transform	465
1. Periodic Systems With $f$ Degrees of Freedom	337		
<b>9 Partial Differential Equations and Special Functions</b>			
1. Series Solutions of Ordinary Differential Equations	472		
2. The Harmonic Oscillator	477		
3. Algebra of Angular Momentum	490		
4. Orbital Angular Momentum and Spherical Harmonics	495		
5. Quantum Central Force Problem	500		
6. Spin and Quaternions	510		
7. Angular Momentum and Rotation	514		
8. Spin $\frac{1}{2}$ Particle in a Magnetic Field	520		

9. Laplace's Equation in Spherical Coordinates	524	2. Exchange of Rows in an Array	654
10. Examples of Solutions of Laplace's Equation	531	3. Multiplication of a Row by a Factor	654
11. Problems in Magnetostatics	537	4. Addition of a Multiple of One Row to Another Row	655
12. Addition Theorem for Spherical Harmonics	546	5. Transpose of an Array	655
13. Introduction to Bessel Functions	555	6. Matrix Multiplication	655
14. Contour Integral Solution of Bessel's Equation	563	7. Orthogonal Transformation of a Vector	656
15. Saddle Point Method	570	8. Second-Rank Tensor Transformation	657
16. Applications of Bessel Functions	581	9. Matrix Inverse	658
17. Spherical Bessel Functions	589	10. Matrix Eigenvalues	659
18. Hankel Transforms	598	11. Schmidt Orthogonalization	662
19. Green Functions	602	12. The Eigenvalues of a Symmetric Matrix	664
20. Green's Function Expansions	606	13. The Characteristic Function of a Matrix	667
<b>10 The Calculus of Variations</b>		14. Finding the Roots of a Function	669
1. The Brachistochrone Problem	616	15. Maxima and Minima	670
2. Surfaces of Revolution of Minimum Area	622	16. Determinants	671
3. Variation of End Points	629	17. Arrays with More Than Two Subscripts	672
4. Isoperimetric Problems	632	18. The Permutation Symbol	672
5. Hamilton's Principle	636	19. Numerical Integration	673
6. Geodesics	639	20. The Runge–Kutta Method	674
7. Continuous Systems	641	21. Summing Series	675
8. Variational Aspects of the Eigenvalue Problem	646	22. Computing with Recurrence Formulas	677
<b>11 Numerical Methods</b>		<b>Bibliography</b>	686
1. The Matrix as an Array of Numbers	653	<b>Index</b>	689
