

# CONTENTS

## PART 1. BACKGROUND THEORY

CHAPTER 1. Introduction to the theory of linear integral equations	
1. Definitions and examples	2
2. Solution by iteration. The Liouville-Neumann series	4
3. Existence of solutions. The Fredholm Alternative	5
4. Proof of the Fredholm Alternative for equations of the second kind	7
5. Characteristic values and characteristic functions	8
6. Singular values and singular functions	10

### CHAPTER 2. Quadrature and Fourier series

1. Simple quadrature rules	12
2. Convergence and correction terms	14
3. Special quadrature formulae	16
4. Construction of Fourier series	18
5. Convergence of Fourier series	21

### CHAPTER 3. Numerical linear algebra

1. Introduction. Systems of linear equations	23
2. Linear least squares problems and the determination of the rank of a matrix	28
3. The algebraic eigenvalue problem	32

### CHAPTER 4. Function spaces and linear operators

1. Motivation: Why talk about function spaces?	41
2. Some relevant vector spaces	42
3. Basic properties of Hilbert spaces	47
4. Linear operators on Hilbert and Banach spaces	49

### CHAPTER 5. Basic approximation theory

1. Introduction	54
2. Types of approximating functions	54
3. Interpolation (collocation)	55
4. Best approximations	57
5. Approximation algorithms	59

## PART 2. GENERAL NUMERICAL METHODS

### CHAPTER 6. Quadrature methods for Fredholm equations of the second kind

1. Introduction	64
2. Formulation of discrete equations	65
3. Choice of quadrature formula	67
4. Use of finite differences	68
5. Deferred approach to the limit	70
6. Nonlinear equations	71
7. Singular integral equations	72
8. Removal of the diagonal term	73
9. Use of product integration methods	74
10. Singularity in the solution	76
11. Error analysis of quadrature methods	76

CHAPTER 7. Expansion methods	
1.	Nature of approximating function 80
2.	Criteria for determining the approximation 81
3.	Choice of $\phi_0(x), \phi_1(x), \dots, \phi_n(x)$ 87
4.	Theory of projection methods 92
5.	Other methods 94
CHAPTER 8. Linear programming solutions to integral equations	
1.	Outline of the method 97
2.	A simple example 98
3.	Further details of the method 99
4.	Error bounds 100
5.	Numerical examples 101
6.	Acknowledgements 106
CHAPTER 9. Rayleigh-Ritz-Galerkin methods	
1.	Introduction 108
2.	The eigenvalue problem 109
3.	Inhomogeneous equations 112
4.	Error estimates 113
5.	Numerical performance 116
6.	Extension to nonlinear equations 120
7.	Comparison with other methods 121
CHAPTER 10. Numerical solution of the eigenvalue problem	
1.	Methods based on quadrature rules 126
2.	Treatment of discontinuities using methods based on approximate integration 132
3.	Expansion methods for the eigenproblem 135
CHAPTER 11. Volterra equations of the second kind	
1.	Introduction 140
2.	Multistep methods 141
3.	Runge-Kutta methods 145
4.	Block methods 148
5.	Spline approximations 150
6.	Convergence and stability 151
7.	A-stability and the cubic spline method 158
CHAPTER 12. Methods for Volterra equations of first kind	
1.	Introduction 162
2.	Conversion to equations of the second kind 163
3.	Numerical methods of solution 164
4.	Use of quadrature rules in the equation of the first kind 164
5.	Higher order accuracy 167
6.	Product integration 170
	Appendix 172
CHAPTER 13. Fredholm equations of the first kind	
1.	Introduction 175
2.	Nature of the problem 175

3.	Singular function analysis	177
4.	Fundamental theorems	178
5.	Applications; noise; need for filtering	179
6.	Method of expansion in singular functions	180
7.	Use of other expansions	181
8.	Method of regularization	182
9.	Iterative methods	184
10.	Probabilistic methods	185
CHAPTER 14. Methods for integro-differential equations		
1.	Introduction. Volterra integro-differential equations	189
2.	Boundary value problems in integro-differential equations	192
3.	Expansion methods for integro-differential equations	196
4.	Partial integro-differential equations	200
CHAPTER 15. Theory of nonlinear integral equations		
1.	The theory of nonlinear integral equations from the standpoint of functional analysis	207
2.	The classical Schmidt-Lichtenstein theory	209
3.	Algebraic integral equations	211
4.	Contractive and monotone equations of second kind	212
5.	Bifurcation	218
6.	Hammerstein integral equations with Green's function kernels	219
7.	Acknowledgements	220
CHAPTER 16. Methods for nonlinear systems of equations		
1.	Direct methods	223
2.	Methods based on functional analysis	225
3.	Iterative procedures, including Newton's method	229
4.	Variational methods	232
5.	Continuation methods	232
6.	Computational aspects of the solution of nonlinear systems	234
7.	Acknowledgements	235
CHAPTER 17. Numerical analysis of methods for nonlinear integral equations		
1.	Construction and implementation of numerical methods for nonlinear integral equations	237
2.	Error analysis	242
3.	Automatic methods	244
4.	Examples	245
5.	Acknowledgements	245
CHAPTER 18. Provision of library programs for the numerical solution of integral equations		
1.	Introduction	247
2.	Brief review of types of problem	248
3.	Procedure of Elliott and Warne	250
4.	Procedure of Pouzet	251
5.	Procedure of Rumyantsev	252

6.	Alternative methods using Chebyshev series	252
7.	Treatment of singular kernels	254

### PART 3. APPLICATIONS

CHAPTER 19.	Singular integrals and boundary value problems	
1.	Singular integral equations	258
2.	Dirichlet's problem	259
3.	Two Fredholm integral equations of the first kind	260
4.	Flow around a hydrofoil	262
5.	The dock problem	264
CHAPTER 20.	Problems in two-dimensional potential theory	
1.	Introduction	267
2.	Boundary value problems for Laplace's equation	267
3.	Integral equation formulations	268
4.	Conformal mapping	270
5.	Numerical approximations	271
6.	Examples	272
CHAPTER 21.	Numerical solution of scalar diffraction problems	
1.	Introduction	275
2.	Mathematical statement of the problem	275
3.	Integral equation formulations for the exterior Neumann problem	277
4.	Failure of the integral equations at interior eigenvalues	279
5.	Improved integral equation formulations	281
6.	Transformation of the operator $N_k$	284
7.	Numerical approximations	285
CHAPTER 22.	A problem in the theory of water waves	
1.	Introduction	291
2.	Series expansions	292
3.	Another approach, by integral equations	297
CHAPTER 23.	Use of finite elements in multidimensional problems in practice	
1.	Introduction	300
2.	The finite-element-type solution of integral equations	303
3.	Applications of the method	305
4.	Numerical results	307
CHAPTER 24.	Potential problems in three dimensions	
1.	Introduction	312
2.	First formulation	313
3.	Second formulation	314
4.	Existence of solutions	315
5.	Discretisation	316

CHAPTER 25. Scattering problems in quantum mechanics

1.	Introduction	321
2.	Collision between two particles	322
3.	Solution for negative $E$	323
4.	Solution for positive $E$	327
5.	Three-body scattering	328
6.	Numerical solution of the Faddeev equations	331
