I Computation of Eigenvalues

1	The method proposed by Picone for computing eigenvalues and eigenvectors of general linear equations	1
2	Computation of the eigenvalues of symmetric operators: statement of the problem	10
3	The Rayleigh–Ritz method and the Plancherel convergence theorem	11
4	The maximum–minimum principle. Weinstein’s method for the clamped plate	12
5	Aronszajn’s formulation and extension of the Weinstein method	15
6	The method of Weyl and Courant concerning the asymptotic distribution of the eigenvalues in the classical problems of mathematical physics	20
7	The Carleman method for the asymptotic theory of eigenvalues and eigenfunctions	23
8	Preliminaries to the orthogonal invariants method	27
9	The orthogonal invariants method for computing lower bounds to the eigenvalues of problem (1.2.1)	30
10	The orthogonal invariants of integral operators	34
11	Eigenvalue problems for ordinary differential equations	35
12	The orthogonal invariants of second order ordinary linear differential operators	47
13	Improvement of the lower bounds using a computer of limited capacity	53
14	Robert’s formulae for the orthogonal invariants	60
15	Invariant subspaces and ordering of the bounds	61
16	Computation of the orthogonal invariants for elliptic differential operators: special theory	62
17	The Green matrix and the eigenvalue computations in the first elastostatic problem	66
18	Iterated elliptic operators: generalized biharmonic problem	69
19	The structure theorem of the Green operator and the orthogonal invariants method for the clamped plate problem	71
20	Computation of the eigenvalues of the square clamped plate	74
21	The eigenvalues of the circular clamped plate	80
22	Eigenvalue problems for plane elasticity	90
23	Invariant subspaces for the elasticity operator in a cube	92
24	Computation of the orthogonal invariants for elliptic differential operators: general theory	94
25	The eigenfrequencies of a heterogeneous elastic body	97
26	The eigenfrequencies of incompressible elastic bodies and the related analytical problems	100
27	Computation of the eigenvalue’s multiplicity	111
28	Approximations and estimates for eigenvectors	115
29	An eigenvalue problem proposed by Ostrowski	117
30	Miscellaneous results concerning eigenvalue theory	119

II 'A Priori' Estimates for Solutions of Differential Equations

1	Global estimates connected with a class of linear transformations	122
2	The general existence principle in Banach spaces and the dual estimation formulae	129
3	Examples of dual estimates	131
4	The maximum modulus theorem for the elasticity equation	134
5	Proof of a conjecture of Mikhlin and extension of the Marcel Riesz inequalities to three-dimensional space	138
6	The estimates for the exterior differential forms equivalent to the existence theorems of de Rham	139
7	Boundary value problems for second order elliptic-parabolic equations and related estimates	141
8	Estimates of physical quantities: the stress concentration coefficient in an incoming vertex of a prism under torsion	163
9	Estimates of physical quantities: the electrostatic capacity of a conductor	167
10	Distribution of electric load near the vertices and the edges of a cube	190
