

Contents

1. Introduction

1.1. Optimal Control Problems	1
1.1.1. Continuous-Time Systems	1
1.1.2. Discrete-Time Systems	2
1.2. Optimal Control Theory	3
1.3. Conventional Methods for Determining Optimal Control	4
1.3.1. Introduction	4
1.3.2. Dynamic Programming	4
1.3.3. The Canonical Equations and Pontryagin's Principle	5
1.3.4. Quasilinearization	7
1.3.5. Successive Approximation to the Optimal Control Function	7
1.4. Differential Dynamic Programming	8
1.4.1. Continuous-Time Systems	9
1.4.2. Discrete-Time Systems	12
1.5. Summary	13
References	14

2. New Algorithms for the Solution of a Class of Continuous-Time Control Problems

2.1. Introduction	17
2.2. A New Second-Order Algorithm for Unconstrained Problems....	17
2.2.1. The Derivation	17
2.2.2. A New "Step Size Adjustment Method"	24
2.2.3. The Computational Procedure	28
2.2.4. Characteristics of the Algorithm	29
2.2.5. A Computational Trick that Improves Convergence Rate	30
2.2.6. Sufficient Conditions for a Reduction in Cost at Each Iteration	31
2.2.7. A New First-Order Algorithm for Unconstrained Problems	31
2.2.8. Characteristics of the First-Order Algorithm	32
2.2.9. Computed Examples	32
2.3. A New Second-Order Algorithm for Fixed Endpoint Problems	38
2.3.1. The Derivation	38
2.3.2. The Computational Procedure	42

2.3.3. Characteristics of the Algorithm	43
2.3.4. Sufficient Conditions for an Improved Trajectory at Each Iteration	43
2.3.5. Final Time t_f Given Implicitly.....	46
2.3.6. The Computational Procedure	52
2.3.7. Characteristics of the Algorithm	52
2.3.8. Sufficient Conditions for an Improved Trajectory at Each Iteration	52
2.3.9. Computed Example	53
2.4. A New Second-Order Algorithm for Free Endpoint Problems with Control Inequality Constraints	58
2.4.1. The Derivation	58
2.4.2. The Computational Procedure	63
2.4.3. Characteristics of the Algorithm	63
2.4.4. Sufficient Conditions for a Reduction in Cost at Each Iteration	64
2.4.5. Control Inequality Constraints: A New First-Order Algorithm	65
2.4.6. Characteristics of the Algorithm	65
2.4.7. Computed Examples	65
2.5. A New Second-Order Algorithm for Fixed Endpoint Problems with Control Inequality Constraints	67
2.5.1. The Derivation	67
2.5.2. The Computational Procedure	68
2.5.3. Sufficient Conditions for an Improved Trajectory at Each Iteration	68
2.5.4. Characteristics of the Algorithm	68
2.6. Summary	69
References	70

3. New Algorithms for the Solution of Bang-Bang Control Problems

3.1. Introduction	71
3.2. A Class of Bang-Bang Control Problems	71
3.2.1. Formulation and Preliminary Investigation	71
3.3. A New Second-Order Algorithm for Free Endpoint Bang-Bang Control Problems	73
3.3.1. Piecewise Differential Dynamic Programming	73
3.3.2. Conditions at Switch Points of the Control Function	74
3.3.3. An Example	79
3.3.4. Implementation of the New Control	81
3.3.5. The Computational Procedure	83
3.3.6. Characteristics of the Algorithm.....	83

3.3.7. Sufficient Conditions for a Reduction in Cost at Each Iteration	83
3.3.8. A New First-Order Algorithm for Free Endpoint Bang-Bang Control Problems	84
3.3.9. Computed Examples	85
3.4. A New Second-Order Algorithm for Fixed Endpoint Bang-Bang Control Problems	87
3.4.1. The Derivation	87
3.4.2. Conditions at Switch Points of the Control Function	90
3.4.3. The Computational Procedure	91
3.4.4. Characteristics of the Algorithm	92
3.4.5. Sufficient Conditions for an Improved Trajectory at Each Iteration	93
3.4.6. Computed Example	93
3.4.7. Final Time Given Implicitly	94
3.5. Dynamic Programming and Pontryagin's Minimum Principle	95
3.5.1. An Interpretation for Pontryagin's Adjoint Variable in Bang-Bang Control Problems	95
3.6. Summary	98
References	98

4. Discrete-Time Systems

4.1. Introduction	99
4.2. Nominal Control Sequence	102
4.3. Differential Dynamic Programming—Small Variations in Control	105
4.3.1. Local Linear Nonoptimal Control Policy	105
4.3.2. A Second-Order Optimization Algorithm for Unconstrained Discrete-Time Problems	109
4.3.3. The Algorithm	112
4.3.4. Properties of the Algorithm	114
4.3.5. An Example	114
4.3.6. First-Order Algorithm	116
4.4. Differential Dynamic Programming—Global Variations in Control	117
4.4.1. The Scalar Case	117
4.4.2. The Vector Case	125
4.4.3. Terminal Constraints	129
4.5. Continuous-Time Systems	129
4.5.1. Nominal Control Function	129
4.5.2. Local Linear Policy—Small Variations in Control	129
4.5.3. Local Optimal Linear Policy—Small Variations in Control ..	130
4.5.4. Local Linear Policy—Global Variations in Control	130

4.5.5. Local Optimal Linear Policy—Global Variations in Control	131
4.6. Summary	131
References.....	132

5. Stochastic Systems with Discrete-Valued Disturbances

5.1. Introduction	133
5.1.1. The Stochastic Control Problem	133
5.1.2. Determination of the Optimal Policy for Discrete-Time Systems	135
5.1.3. Determination of the Optimal Policy for Continuous-Time Systems	137
5.1.4. Noisy Observations	139
5.1.5. Conclusion	141
5.2. System Description	141
5.3. The Addition Rule	144
5.4. Differential Dynamic Programming	149
5.4.1. The Addition Rule	149
5.4.2. A Second-Order Algorithm for the Determination of an Optimal (Feedback) Control Function	153
5.4.3. An Illustrative Example	155
5.4.4. Linear Systems, Quadratic Cost Function	157
5.4.5. Integration Along Basic Realizations	159
5.4.6. First-Order Algorithm for the Determination of an Optimal (Feedback) Control Function	160
5.4.7. Necessary Condition for Optimality	161
5.4.8. A First-Order Algorithm for the Determination of an Optimal Open-Loop Control Function (Schedule)	163
5.5. Conclusion	164
References.....	165

6. Stochastic Systems with Continuous Disturbances

6.1. Introduction	167
6.2. “Naive” Monte-Carlo Gradient Techniques for Discrete-Time Systems	168
6.2.1. Determination of the Optimal Control Action for a Given State	168
6.2.2. Determination of Optimal Parameters	172
6.2.3. Determination of Optimal Schedule	173
6.3. “Naive” Monte-Carlo Gradient Techniques for Continuous-Time Systems	174
6.3.1. Determination of the Optimal Control Action for a Given State	174
6.3.2. Determination of Optimal Parameters	178
6.3.3. Determination of Optimal (Open-Loop) Control	178

6.4. Variance Reduction Techniques	179
6.4.1. The Antithetic Variate Method	179
6.4.2. Control Variate Method	181
6.4.3. Conclusion	182
6.5. Accelerated Monte-Carlo Gradient Method for Optimizing Stochastic Systems	182
6.5.1. Introduction	182
6.5.2. Estimation of Control Parameters Using the Antithetic Variate Method	183
6.5.3. Application of the Antithetic Variate Method to the LQS Problem	183
6.5.4. Control Variate Technique	187
6.6. Optimal Linear Control Policy	188
6.7. Stochastic Systems with Control Constraints	189
6.8. Some Examples	190
6.9. Conclusion	192
References.....	192
Appendix	194

7. Conclusion

7.1. The Significance of Differential Dynamic Programming	196
7.2. Extensions of Differential Dynamic Programming: Deterministic Systems	197
7.3. Extensions of Differential Dynamic Programming: Stochastic Systems	197
References.....	197

Appendix A—Second-Order and Successive Sweep Algorithms: A Comparison

A.1. Introduction	199
A.2. A Second-Order Weak Variation Algorithm	199
A.3. The Successive Sweep Algorithm	200
A.4. Differences Between The Algorithms of Sections A.2. and A.3...	201
A.5. Conclusion	202
References	202

Appendix B—Error Analysis for Bang-Bang Algorithms

B.1. Introduction	203
B.2. Error Analysis	203
Reference	204
