Preface xiii

1. Convolution and Related Concepts

Peter A. Jansson

I. Introduction	3
II. Definition of Convolution	4
III. Properties	7
IV. Fourier Transforms	11
V. The Problem of Deconvolution	28
References	34

2. Distortion of Optical Spectra

Peter A. Jansson

I. Inherent Line Breadth	38
II. Contribution of Dispersive Spectrometer	44
III. Resolution Criteria	61
References	64

3. Traditional Linear Deconvolution Methods

Peter A. Jansson

I. Direct Approach	69
II. Van Cittert's Method	71
III. Matrix Inversion	73
IV. Inverse Filters	80
V. Other Linear Methods	87
VI. Overview of Linear Methods	89
References	91

4. Modern Constrained Nonlinear Methods

Peter A. Jansson

I. Introduction	96
II. Meaning of Constraints	97
III. The Promise of Analytic Continuation	97

IV. Early Constrained Methods	99	
V. Greater Realization of Constraint Benefits		102
VI. Other Methods	128	
VII. Concluding Remarks	130	
References	132	

5. Application to Electron Spectroscopy for Chemical Analysis

Peter A. Jansson

I. Introduction	136	
II. Distortions Present in ESCA Spectra		138
III. Correction of Distortions	141	
IV. Applications	145	
V. Concluding Remarks	150	
References	151	

6. Instrumental Considerations

William E. Blass and George W. Halsey

I. Introduction	155	
II. Resolution-Acquisition-Time Trade-Offs	156	
III. Acquiring the Data: Dispersive Spectrophotometers		157
IV. Details of Spectroscopic Experiments	173	
V. Preparing to Deconvolve a Data Set	179	
VI. Deconvolving the Data: Constrained Deconvolution		182
References	185	

7. Deconvolution Examples

George W. Halsey and William E. Blass

I. Introduction	188	
II. Examining the Deconvolution Process		188
III. Deconvolution, Noise, and Smoothing		195
IV. Relaxation Methods	201	
V. Operating Considerations	206	
VI. Deconvolution of Other Types of Spectra		211
VII. Deconvolution Examples	215	
References	225	

8. Maximum-Likelihood Estimates of Spectra

B. Roy Frieden

I. Introduction	229
II. Orientation	230
III. Physical Model for the Object	232
IV. Most Probable Object: Definition	235
V. Most Probable Object in the Presence of Data	237
VI. Object-Class Law	238
VII. Case of a "White" Object; Maximum Entropy	239
VIII. Scenarios for Knowing $p(q_1, \dots, q_M)$	240
IX. Estimators	246
X. How to Handle Noise	250
XI. Test Cases	252
XII. Conclusion	258
References	258

9. Fourier Spectrum Continuation

Samuel J. Howard

I. Introduction	262
II. Advantages of Fourier Analysis	264
III. Restoration and Enhancement of Experimental Data	264
IV. Discrete Fourier Transform and Discrete Function Continuation	271
V. Constraint of Finite Extent	278
VI. Concluding Remarks	285
References	286

10. Minimum-Negativity-Constrained Fourier Spectrum Continuation

Samuel J. Howard

I. Theory	290
II. Application	295
III. Concluding Remarks	323
References	330

Index	333
