Preface to the Third Edition	xi
From the Preface to the Second Edition	xiii
Translator's Preface	xv
CHAPTER I. METHODS BASED ON THE REPRESENTATION OF THE SOLUTION AS AN INFINITE SERIES	
§ 1. Fourier's method	1
1. The Dirichlet problem for the rectangle (1). 2. The Dirichlet and Neumann problems for an annulus in the case of the Laplace equation (13). 3. An example of the biharmonic problem (17).	
§ 2. Infinite systems of equations	20
1. Fundamental definitions (20). 2. Theorems on the comparison of systems (21). 3. Regular and fully regular systems (26). 4. The approximate solution of regular systems (33.) 5. Limitants. Diverse generalizations of regular systems (38). 6. Brief survey of other investigations relating to infinite systems (42).	
§ 3. The solution of boundary-value problems by means of non-orthogonal series	44
1. General principles (44). 2. Solution of the problem of the expansion of an arbitrary function in terms of preassigned functions by means of orthogonalization (45). 3. Solution of the problem of the expansion of an arbitrary function in terms of given functions by means of infinite systems of equations (54). 4. Example 1: A mixed boundary-value problem for the Laplace equation (56). 5. Example 2: The clamped plate (61).	
§ 4. The application of double series to the solution of boundary-value problems	68
1. Statement of the problem. The foundations of the method (68). 2. Poisson's equation for the rectangle (70). 3. Application to equations of the fourth order (72).	
§ 5. The improvement of the convergence of series	77
1. The general principles on which methods for improving the convergence are founded (77). 2. The method of Acad. A. N. Krylov for improving the convergence of trigonometric series (79). 3. Fourier series with strengthened convergence (A. S. Maliev) (86). 4. General methods for improving the convergence of approximate solutions of boundary-value problems (89).	

CHAPTER II. THE APPROXIMATE SOLUTION OF THE INTEGRAL EQUATIONS OF FREDHOLM

§ 1.	The replacement of an integral equation by a system of linear equations	97
	1. Fundamental definitions (97). 2. The replacement of an integral equation by a finite system of linear equations (98). 3. The evaluation of the error incurred by replacing the integral equation by a system of linear equations (103). 4. Example (108).	
§ 2.	The method of successive approximations and analytic continuation	110
	1. The method of successive approximations (110). 2. The application of analytic continuation for the approximate solution of integral equations (116).	
§ 3.	The application of integral equations to the solution of the Dirichlet problem	119
	1. An integral equation of potential theory (119). 2. Neumann's method (124). 3. The method of N. M. Krylov and N. N. Bogoliubov (130). 4. Example (135).	
§ 4.	The solution of integral equations by replacing an arbitrary kernel by a degenerate one	141
	1. The integral equation with degenerate kernel (141). 2. Replacement of an arbitrary kernel by a degenerate one (143). 3. Example (145). 4. Another estimate of the error (147). 5. The method of moments (150). 6. Bateman's method (155).	

CHAPTER III. THE METHOD OF NETS

§ 1.	Expressions for the derivatives in terms of difference ratios. Relations between the values of a function at the nodes of a net and the harmonic and biharmonic operators	162
	1. Expressions for the derivatives in terms of difference ratios (162). 2. Relations between the values of a function at the nodes of a net and the Laplace and biharmonic operators (179).	
§ 2.	Differential equations and the finite-difference equations that correspond to them	191
	1. Ordinary differential equations (191). 2. Partial differential equations of elliptic type (200). 3. Boundary conditions for finite-difference equations (212). 4. The equation $\Delta^2 u = f(x, y)$ (215).	
§ 3.	The solution of finite-difference equations.	217
	1. The existence and uniqueness of the solution (217). 2. Two methods of solving finite-difference equations. Examples (222). 3. Estimate of the error. The convergence of the process (231).	

CHAPTER IV. VARIATIONAL METHODS

§ 1.	Variational problems connected with the most important differential equations.	241
	1. Problems leading to an ordinary differential equation (241). 2. Variational problems leading to the Laplace and Poisson equations (246).	

3. Other forms of boundary conditions (249). 4. Variational problems connected with the biharmonic equation (252). 5. Variational problems connected with the determination of proper numbers and proper functions (255).

§ 2. Ritz's method and the method of B. G. Galerkin 258
 1. The fundamental idea of Ritz's method and of the method of B. G. Galerkin (258). 2. Application of Ritz's method and that of B. G. Galerkin to ordinary differential equations (262). 3. The application of the methods of Ritz and of B. G. Galerkin to the solution of partial differential equations of the second order (272). 4. Application to the biharmonic equation (283). 5. Application to the determination of the proper values and functions (292).

§ 3. Reduction to ordinary differential equations 304
 1. Fundamental equations (306). 2. Examples of the determination of the first approximation (309). 3. Examples of the refinement of the solution (316). 4. An example of the application of the method to the biharmonic equation (322). 5. Application of the method to the determination of proper values and proper functions (325).

§ 4. Estimate of the error in variational methods and their order of convergence. 327
 1. The case of ordinary differential equations (327). 2. The problem of the convergence of the minimal sequences for equations of elliptic type (337). 3. The convergence of Ritz's method and of the method of reduction to ordinary equations (347).

CHAPTER V. THE CONFORMAL TRANSFORMATION OF REGIONS

§ 1. Introduction 358
 1. Conformal transformation and the Laplace equation (358). 2. The transformation of simply connected regions (360). 3. The transformation of multiply connected regions (362).

§ 2. The property of minimum area in the transformation of a region into a circle. 365
 1. An extremal property of the function transforming a region into a circle (365). 2. Application of Ritz's method (367). 3. Minimization by means of polynomials (371). 4. The convergence of the successive approximations. The completeness of the system of coordinate functions (372). 5. Exterior regions (375).

§ 3. The property of minimum contour length in the transformation of a region into a circle. 376
 1. The extremal property of the transforming function (376). 2. The application of Ritz's method (377). 3. The transformation of exterior regions (379).

§ 4. Orthogonal polynomials and conformal transformation . . 381
 1. Polynomials orthogonal on the contour (381). 2. Application to conformal transformation (383). 3. Polynomials orthogonal in a region (387). 4. Application to conformal transformation (389).

§ 5. Expansion in a series of the powers of a small parameter in the case of the transformation of a region into a circle 390
 1. Statement of the problem. Reduction to a system of equations (390). 2. The method of successive approximations (400). 3. The conformal transformation of exterior regions (405).

§ 6.	Expansion in a series of the powers of a small parameter in the case of the transformation of a circle into a region	414
	1. The normal representation of a contour (414). 2. The method of infinite systems (415). 3. Examples (419). 4. The method of successive approximations for regions close to a circle, the contour of the regions being given by an implicit equation (424). 5. The method of successive approximations for regions close to those into which the conformal transformation of a circle is known (427). 6. The method of successive approximations for curves given in parametric form (431). 7. Proof of the convergence of the process of successive approximations (435). 8. Observations on the mapping of a circle onto the exterior of a curve. Examples (445).	
§ 7.	Melentiev's method of approximate conformal transformation	451
	1. The algorithm of successive approximations (451). 2. Choice of the first approximation. Computational scheme (459). 3. The mapping of exterior regions (472). 4. The case of symmetric contours. Examples (474).	
§ 8.	Green's functions and the conformal transformation of regions	478
	1. Introduction. Green's function for the Dirichlet problem (478). 2. Approximate construction of Green's function (485). 3. Green's function for the Neumann problem (490). 4. Green's function for the mixed problem (496).	
§ 9.	The application of integral equations to conformal transformation	501
	1. The integral equation for the transformation of interior regions (501). 2. Observations on the solution of the integral equation and the approximate construction of the mapping function (506). 3. The integral equation for the transformation of exterior regions (508). 4. The transformation of a region into a plane with parallel cuts (512). 5. The transformation of a multiply connected region into a plane with cuts lying on rays originating at one point (517).	
§ 10.	Mapping a polygon on a half plane.	521
	1. Derivation of the Christoffel-Schwarz formula (521). 2. The value of the parameters in the Christoffel-Schwarz integral (523). 3. On the Newton-Fourier method for a system of equations, and on the computation of the improper integrals (526). 4. Examples (528). 5. The mapping of a half plane on an arbitrary quadrilateral (534).	

**CHAPTER VI. PRINCIPLES OF THE APPLICATION OF CONFORMAL
TRANSFORMATION TO THE SOLUTION OF THE FUNDAMENTAL
PROBLEMS FOR CANONICAL REGIONS**

§ 1.	Introduction	543
	1. The transformation of the Laplace operator (543). 2. The transformation of the biharmonic operator. Goursat's formula. The connection of biharmonic functions with the plane problem of the theory of elasticity (544). 3. Transformation of the boundary conditions (553). 4. Integrals of the Cauchy type; their computation (556).	

§ 2. The Dirichlet problem 561
 1. The Poisson integral (561). 2. The Poisson integral for the exterior of a circle (565). 3. The Dirichlet problem for a half plane (567). 4. Dirichlet's problem for the annulus (568). 5. Schwarz's formula. Determination of the conjugate harmonic function (569). 6. Solution of the Poisson equation in the circle (572).

§ 3. The Neumann problem. 575
 1. Dini's formula (575). 2. The exterior of a circle (578). 3. Neumann's problem for a half plane (579). 4. Neumann's problem for the annulus (581).

§ 4. The general boundary-value problem for harmonic functions 582
 1. The problem stated. The case of constant coefficients in the boundary condition (582). 2. Hilbert's problem (587). 3. The general boundary-value problem (591).

§ 5. The fundamental problems for biharmonic functions . . . 595
 1. First fundamental problem. Reduction to a system of equations (595). 2. The second fundamental problem. Reduction to a system of equations (605). 3. First fundamental problem. Reduction to functional equations (606). 4. Second fundamental problem. Reduction to functional equations (614).

CHAPTER VII. SCHWARZ'S METHOD

§ 1. Schwarz's method for the solution of the Dirichlet problem for the sum of two regions 616
 1. Schwarz's method in the general case. Investigation of the convergence (616). 2. The case of a linear equation of elliptic type. An estimate of the rapidity of convergence of Schwarz's process for the Laplace equation (626). 3. Reduction of Schwarz's method to the solution of a system of integral equations by successive approximations (635).

§ 2. The Schwarz-Neumann method for the solution of the Dirichlet problem for the intersection of two regions . . . 640
 1. Description of the method and investigation of the convergence of the successive approximations (640). 2. Example of the investigation of the convergence of the Schwarz-Neumann method. An estimate of the rate of convergence in the case of the Laplace equation (652). 3. Reduction of the Schwarz-Neumann method to the solution of a system of integral equations by successive approximations (655).

§ 3. An example of the application of Schwarz's method 659
