CHAPTER I. Special Classes of Convex Functions

§ 1.	<i>N</i> -functions Convex functions (1). Integral representation of a convex function (3). Definition of <i>N</i> -function (6). Properties of <i>N</i> -functions (7). Second definition of <i>N</i> -function (9). Superposition of <i>N</i> -functions (10).	1
§ 2.	Complementary <i>N</i> -functions Definition (12). Young's inequality (13). Examples (15). Inequality for complementary functions (16).	12
§ 3.	Congruency of <i>N</i> -functions Definition (16). Equivalent <i>N</i> -functions (17). Principal part of an <i>N</i> -function (18). A criterion of equivalence (19). Existence of different classes (22).	16
§ 4.	Δ_2 -condition Definition (25). Criteria of Δ_2 -condition (27). Δ_2 -condition for complementary <i>N</i> -functions (28). Examples (30).	25
§ 5.	Δ' -condition Definition (33). Sufficient criteria for the satisfaction of the Δ' -condition (34). Δ' -condition for complementary functions (36). Examples (37).	33
§ 6.	<i>N</i> -functions which increase more quickly than powers Δ_2 -condition (39). Evaluations for complementary functions (40). Construction of <i>N</i> -functions equivalent to their complementary <i>N</i> -functions (41). Superposition of complementary functions (43). Δ^2 -condition (45). Properties of complementary functions (49). Criterion of Δ^2 -condition for complementary functions (52). Superposition of <i>N</i> -functions (54).	39
§ 7.	A class of <i>N</i> -functions Setup of Problem (58). The class \mathfrak{M} (59). The class \mathfrak{R} (62). Theorem on complementary functions (65).	58

CHAPTER II. Orlicz Spaces

§ 8.	Orlicz classes Definition (66). Jensen integral inequality (68). Congruency of classes (69). Structure of the Orlicz class (70).	66
------	---	----

§ 9.	The space L_M^*	73
	Orlicz norm (73). Completeness (77). Norm of the characteristic function (78). Hölder inequality (79). The case of Δ_2 -condition (81). Mean convergence (82). Luxemburg norm (85).	
§ 10.	The space E_M	88
	Definition (88). Separability of E_M (89). Ordering of the class L_M with respect to the space E_M (89). Necessary condition for separability of the Orlicz space (93). Determination of norm (94). Absolute continuity of the norm (95). Calculation of norm (96). Another formula for the norm (100).	
§ 11.	Criteria of compactness	102
	Vallée-Poussin theorem (102). Steklov functions (103). Kolmogorov criterion of compactness for the space E_M (105). Second criterion of compactness (107). F. Riesz criterion of compactness for the space E_M (108).	
§ 12.	Existence of basis	110
	Transition to the space of functions defined in an interval (110). Haar functions (112). Basis in E_M (114). Condition of separability (continued) (116).	
§ 13.	Space defined by different N -functions	120
	Congruency of spaces (120). Inequality for norms (122). A criterion of norm convergence (124). Products of functions of Orlicz spaces (127). Sufficient conditions (131).	
§ 14.	Linear functionals	136
	Linear functionals in L_M^* (136). General form of a linear functional on E_M (140). E_N -weak convergence (142). E_N^- -weak continuous linear functionals (145). Norm of a functional and $\ v\ _{(N)}$ (147).	
CHAPTER III. Operators in Orlicz Spaces		
§ 15.	Conditions of continuity of linear integral operators	149
	Problematic setup (149). General theorem (150). Existence of the function $\Phi(u)$ (151). A property of N -functions which satisfies the Δ' condition (153). Sufficient conditions of continuity (158). Decomposition of a continuous operator (160).	
§ 16.	Conditions for complete continuity of linear integral operators	163
	The case of continuous kernels (163). Fundamental theorem (164). Complete continuity and E_N -weak convergence (166). Zaanen theorem (170). Comparison of	

conditions (174). Decomposition of completely continuous operator (179). Operators of potential type (181).

§ 17. Simplest Non-linear operator 183

Carathe'odory condition (183). Domain of definition of the operator f (183). Theorems on continuity (186). Boundedness of the operator f (189). General form of the operator f (190). Sufficient conditions for continuity and boundedness of the operator f (191). The operator f and E_N -weak convergence (192).

§ 18. Differentiability. Gradient of a norm 193

Differentiable functionals (193), Measurability of the function $\theta(x)$ (193). Functional for the operator f (195). Linear operator f (196). Fre'chet derivative (196). Special condition of differentiability (199). Auxiliary lemma (204), Gato gradient (204). Gradient of the Luxemburg norm (205). Gradient of the Orlicz norm (207).

CHAPTER IV. Nonlinear Integral Equations

§ 19. Uryson operator 212

Uryson operator (212). Boundedness of the Uryson operator (214). Transition to a simpler operator (215). Second transition to a simpler operator (217). Third transition to a simpler operator (218). Fundamental theorem on complete continuity of the Uryson operator (219). The case of weak non-linearity (222). Hammerstein operators (225).

§ 20. Some existence theorems 226

Formulation of some problems (226). Existence of solutions (228). Positive proper functions (231). Proper functions of potential operators (233). Theorem on the points of bifurcation (235).

Summary of fundamental results 236
