

TABLE OF CONTENTS

Preface	IX
Chapter 1	
General methods of the qualitative theory	
1.1. Some stability theorems	1
1.2. Criteria for boundedness	44
1.3. Periodic solutions of autonomous systems	66
1.4. Existence of periodic solutions in non-autonomous systems	72
References for Chapter 1	123
Chapter 2	
Stability and boundedness on the basis of approximations	
2.1. General comparison theorems	131
2.2. Investigations by means of series expansions according to Lyapunov-Malkin	162
2.2.1. Stability and instability in the m -th approximation	162
2.2.2. The critical cases for certain third and fourth order systems	173
2.2.3. Transformation of the fundamental equations	176
2.2.4. Case of one vanishing root	179
2.2.5. Case of a pair of purely imaginary roots	180
2.2.6. Case of two vanishing roots (simple elementary divisors)	183

Table of contents

2.2.7. Case of two vanishing roots (twofold elementary divisor) 190	
2.2.8. Extension of the results to systems containing non-critical variables 194	
2.2.9. Application of the theorems to differential equations of the third and fourth order 201	
References for Chapter 2	206

Chapter 3

The behaviour of the trajectories of autonomous systems

3.1. Linear systems of three equations	216
3.1.1. The reduced systems in the non-singular case	216
3.1.2. Behaviour of the trajectories of the reduced systems	218
3.1.3. The singular case	228
3.1.4. Behaviour of the trajectories at infinity	234
3.2. Some examples of non-linear systems of the third order	234
3.2.1. Differential equations of the Jacobi elliptic functions	234
3.2.2. The system of Kasner	236
3.2.3. Examples of Bielecki-Zaremba and others	238
3.3. Behaviour of the trajectories in the neighbourhood of a singular point	240
3.3.1. The system of Reizin	240
3.3.2. Exceptional directions	242
3.3.3. Sufficient conditions for a stellar node	244
3.3.4. Case of an isolated exceptional direction	250
3.4. Behaviour of the trajectories in the neighbourhood of a limit cycle	254
3.5. The trajectories of an autonomous system of n equations	258
References for Chapter 3	261

Chapter 4

The equation of type $x''' + ax'' + \varphi(x, x') + f(x) = p(t)$		
4.1.	Stability in the autonomous case [$p(t) \equiv 0$]	264
4.2.	Boundedness and existence of periodic solutions in the non-autonomous case [$p(t) \not\equiv 0$]	287
	References for Chapter 4	366

Chapter 5

The equation of type $x''' + \psi(x, x')x'' + \varphi(x') + f(x) = p(t)$ and other equations		
5.1.	The autonomous case	369
5.2.	The non-autonomous case	401
	References for Chapter 5	418

Chapter 6

The equation of type $x'''' + \chi(x'')x''' + \psi(x')x'' + \varphi(x') + f(x) = p(t)$ and more general types		
6.1.	The autonomous case	420
6.2.	The non-autonomous case	437
	References for Chapter 6	458

Chapter 7

Systems of arbitrary order		
Non-linearities with separate variables		
7.1.	General stability considerations and Aizerman's problem	460
7.2.	Stability of some second order systems	470
7.3.	Investigations of stability for certain third order systems	504
7.4.	Boundedness of the solutions for certain non-autonomous systems of the third order	553
	References for Chapter 7	572

Table of contents

Chapter 8

n-th order systems of Lur'e type

8.1. Fundamental equations and statement of the problem	575
8.2. Derivation of sufficient criteria for absolute stability by construction of Lyapunov functions	588
8.3. Criterion of Popov for absolute stability in the angle $[0, k]$ for direct control	598
8.4. Criteria of Corduneanu for absolute stability in the case of indirect control	612
8.5. Connection of the criteria of Popov with the existence of certain Lyapunov functions	631
8.5.1. The principal case and the simplest singular case	631
8.5.2. Some inequalities for matrices	638
References for Chapter 8	658
Subject index	665
