Preface xiii

Acknowledgments xvii

List of symbols xix

I
Basic notions

1. A problem from differential equations 2
2. An examination of the results 8
3. Examples of Banach spaces 10
4. Fourier series 19
Problems 26

II
Duality

1. The Riesz representation theorem 28
2. The Hahn–Banach theorem 32
3. Consequences of the Hahn–Banach theorem 37
4. Examples of dual spaces 40
Problems 53

III
Linear operators

1. Basic properties 56
2. The adjoint operator 58
3. Annihilators 60

4. The inverse operator 62
5. Operators with closed ranges 69
6. The uniform boundedness theorem 75
Problems 76

IV
The Riesz theory for compact operators

1. A type of integral equation 80
2. Operators of finite rank 88
3. Compact operators 92
4. The adjoint of a compact operator 100
Problems 103

V
Fredholm operators

1. Orientation 106
2. Further properties 110
3. Perturbation theory 114
4. The adjoint operator 118
5. A special case 121
6. Semi-Fredholm operators 125
Problems 130

VI
Spectral theory

1. The spectrum and resolvent sets 132
2. The spectral mapping theorem 137
3. Operational calculus 138
4. Spectral projections 146
5. Complexification 153
6. The complex Hahn–Banach theorem 155
7. A geometric lemma 157
Problems 158

VII
Unbounded operators

1. Unbounded Fredholm operators 161
2. Further properties 167
3. Operators with closed ranges 171

4. Total subsets 176
5. The essential spectrum 178
6. Unbounded semi-Fredholm operators 181
Problems 186

VIII
Reflexive Banach spaces

1. Properties of reflexive spaces 189
2. Saturated subspaces 191
3. Separable spaces 195
4. Weak convergence 198
5. Examples 199
6. Completing a normed vector space 204
Problems 205

IX
Banach algebras

1. Introduction 208
2. An example 212
3. Commutative algebras 214
4. Properties of maximal ideals 217
5. Partially ordered sets 219
Problems 221

X
Semigroups

1. A differential equation 224
2. Uniqueness 227
3. Unbounded operators 229
4. The infinitesimal generator 235
5. An approximation theorem 240
Problems 242

XI
Hilbert space

1. When is a Banach space a Hilbert space? 244
2. Normal operators 247
3. Approximation by operators of finite rank 255

4. Integral operators 257
5. Hyponormal operators 261
Problems 268

XII
Bilinear forms

1. The numerical range 271
2. The associated operator 272
3. Symmetric forms 274
4. Closed forms 277
5. Closed extensions 282
6. Closable operators 288
7. Some proofs 292
8. Some representation theorems 296
9. Dissipative operators 297
10. The case of a line or a strip 303
11. Self-adjoint extensions 308
Problems 310

XIII
Self-adjoint operators

1. Orthogonal projections 313
2. Square roots of operators 315
3. A decomposition of operators 321
4. Spectral resolution 324
5. Some consequences 330
Problems 333

XIV
Examples and applications

1. A few remarks 336
2. A differential operator 336
3. Does A have a closed extension? 341
4. The closure of A 342
5. Another approach 347
6. The Fourier transform 352
7. Multiplication by a function 354
8. More general operators 360
9. $\bar{B}$-Compactness 364

10. The adjoint of $\bar{A}$ 366
11. An integral operator 368
Problems 374

Bibliography 378
