CONTENTS

XI. EXPANSIONS IN A RECTANGLE

11.1. Statement of the problem 1
11.2. The case $q(\mathbf{x}) = 0$; the Parseval formula . . . 2
11.3. The Green's function 4
11.4. Properties of the Green's function 5
11.5. The function $\Phi(\mathbf{x}, \lambda)$ 9
11.6. Introduction of the function $q(\mathbf{x})$ 11
11.7. The Green's function 14
11.8. Inequality for $\Phi(\mathbf{x}, \lambda)$ 18
11.9. Analytic continuation of the Green's function . . . 18
11.10. The singularities of the Green's function . . . 20
11.11. Nature of the residue of $G(\mathbf{x}, \boldsymbol{\xi}, \lambda)$ at λ_n . . . 23
11.12–13. Lemmas 25
11.14. The expansion theorem 27
11.15. The Parseval formula 29
11.16. An alternative method 30
11.17. Other boundary conditions 31

XII. EXPANSIONS IN THE WHOLE PLANE

12.1. Definition of the Green's function 34
12.2. Properties of the Green's function 36
12.3. Lemmas 38
12.4. The function $H(\mathbf{x}, \boldsymbol{\xi}, \mu)$ 41
12.5. The function $\Phi(\mathbf{x}, \lambda)$ 45
12.6–7. Lemmas 45
12.8. The expansion theorem 47
12.9. The Parseval formula 50
12.10. The spectrum 55
12.11–12. The problem of uniqueness 56
12.13. Generalization of the orthogonal property of eigenfunctions . 59
12.14. Further properties of $\Phi(\mathbf{x}, \lambda)$ 60
12.15. The function $J(f, \mu)$ 62
12.16. Relation between the above theory and the general theory of linear operators 63

XIII. EXTENSIONS OF THE THEORY

13.1. The Green's function in k dimensions 66
13.2. The case $4 \leqslant k \leqslant 7$ 67
13.3. Extension of the remaining theory of Chapter XI . . 70
13.4. The expansion theorem and Parseval theorem . . . 72

13.5. Extension of the argument of Chapter XII . . . 74
13.6. Extension to values of k greater than 7 . . . 77
13.7. The problem of the whole space with $q(\mathbf{x}) = 0$ . . . 78
13.8–9. Extension to a more general form of differential equation . 79
13.10. Analytic continuation of the Green's function . . . 81
13.11. Extension to the whole plane 83
13.12. Extension of the theory to the case where $q(\mathbf{x})$ is discontinuous 83
13.13. Extensions to cases in which $q(\mathbf{x})$ has singularities . . 84

XIV. VARIATION OF THE EIGENVALUES: THE PROBLEM OF THE GENERAL FINITE REGION
14.1–3. The integral $D(f, g)$ 86
14.4. Variation of the eigenvalues with $q(\mathbf{x})$ 88
14.5. Variation of the eigenvalues with the region . . . 90
14.6. Problems with different boundary conditions . . . 90
14.7. The more general equation 91
14.8. Problems involving infinite regions 92
14.9. Extension to the case of possibly continuous spectra . . 95
14.10–11. The problem of a general finite region . . . 97
14.12–13. Behaviour of $\psi_n(\mathbf{x})$ on the boundary . . . 99
14.14. The Parseval formula 104
14.15. The expansion formula 104
14.16. The Green's function 106
14.17. Alternative methods 108
14.18. The problem with boundary condition $\partial\psi/\partial n = 0$ . . 110

XV. SEPARABLE EQUATIONS
15.1. Eigenvalues of separable equations 113
15.2. The case of a rectangle 114
15.3. The case of the whole plane 115
15.4–6. Relations between the Green's functions in the above problems 115
15.7. Examples 122
15.8–9. The case $q = q(r)$ 123
15.10. Examples 126
15.11. The problem of the circle analogous to the problem of the rectangle considered in Chapter XI 128
15.12–14. Problems in three dimensions 129
15.15. The hydrogen atom 133
15.16–19. The hydrogen atom in an electric field . . . 134

XVI. THE NATURE OF THE SPECTRUM
16.1. Characterization of the spectrum 144
16.2. The point spectrum 144

16.3. The spectrum 145
16.4–5. A condition for the discreteness of the spectrum . . 148
16.6. The more general equation 153
16.7. Finite multiplicity of the spectrum 155
16.8. The case where $q(\mathbf{x})$ tends to zero at infinity . . . 156
16.9. The case where $q(\mathbf{x}) \to -\infty$ 158
16.10–12. The problem of the helium atom 159

XVII. THE DISTRIBUTION OF THE EIGENVALUES
17.1–3. The function $N(\lambda)$ 166
17.4. Distribution of eigenvalues in k-dimensional problems . . 169
17.5. Properties of the Green's function 169
17.6. Application to the problem of the distribution of eigenvalues . 171
17.7. The problem with a variable $q(\mathbf{x})$ 173
17.8. The problem of the whole space 174
17.9. Method of subdivision 175
17.10–14. Another method 177

XVIII. CONVERGENCE AND SUMMABILITY THEOREMS
18.1–5. Bounds for eigenfunctions 186
18.6. The average order of the eigenfunctions . . . 193
18.7. Further approximations to $\Psi(\lambda)$ 197
18.8–9. The convergence problem 199
18.10. Summability 202
18.11–12. The case $q(\mathbf{x}) = 0$ 204
18.13. The summability problem with $q \neq 0$ 209
18.14. Theorems of the opposite type 210
18.15. Improvement of the index in summability theorems . . 213

XIX. PERTURBATION THEORY
19.1. Statement of the problem 217
19.2–3. Formalities 218
19.4. The case of 'degeneracy' 221
19.5–6. Convergent perturbation formulae 223
19.7–14. Asymptotic perturbation formulae 229
19.15. The next approximation 242
19.16. Approximations to $\Psi_m(\mathbf{x})$ 243
19.17. Examples from the theory of the Hermite expansion . . 244
19.18. Another example 245
19.19. An example of the degenerate case 246
19.20–22. Another method in perturbation theory . . . 247
19.23–25. Application to relativistic quantum theory . . . 251

XX. PERTURBATION THEORY INVOLVING CONTINUOUS SPECTRA

20.1–3. Statement of the problem 258
20.4. The one-dimensional problem 262
20.5–6. Approximation to $w(\lambda, \epsilon)$ 264
20.7. The poles of the perturbed Green's function . . . 268
20.8. The distance between the pole of the perturbed Green's function and the real axis 268
20.9. The case $q(x) = 0$, $s(x) = -x$ 271
20.10. The case $q(x) = x$, $s(x) = -x^2$ 273
20.11. The case $q(x) = \frac{1}{4}(m^2-1)x^{-2}-ax^{-1}$, $s(x) = -x$ . . . 276
20.12. The formulae of § 20.3 277
20.13. The problem of § 20.4 280
20.14–16. The case $q(\mathbf{x}) = -a/r$, $s(\mathbf{x}) = z$ 282

XXI. THE CASE IN WHICH $q(\mathbf{x})$ IS PERIODIC

21.1–4. The one-dimensional problem 290
21.5. Distribution of the numbers λ_n and μ_n 295
21.6. Expansion formula and Parseval formula . . . 299
21.7. Behaviour of $\psi_1(x, \lambda)$ and $\psi_2(x, \lambda)$ for large complex values of λ . 301
21.8. A convergence theorem 303
21.9. The Parseval formula 306
21.10. Relations between the above problem and other eigenvalue problems 308
21.11–13. A perturbation problem 310
21.14. Problems in more than one dimension 316
21.15. Nature of the eigenfunctions in cyclic problems. . . . 318
21.16. Perturbation problems 319

XXII. MISCELLANEOUS THEOREMS

22.1. Integrals involving functions with singularities . . . 323
22.2–14. Theorems connected with Green's formulae . . . 325
22.15–16. The case $q(\mathbf{x}) \geqslant -Q(r)$ 335
22.17. Extensions to k dimensions 338
22.18. Compact sequences of functions 340
22.19. Helly's selection theorem 342
22.20. An alternative method 343
22.21. A theorem of Rellich 345
22.22–24. Boundary values of analytic functions . . . 345
22.25. Solution of differential and integral equations by methods of iteration 351
22.26. The case of infinite intervals 353

22.27–28. Method of Langer 356
22.29. Laguerre polynomials 362
22.30–31. Tauberian theorems 364
22.32. An alternative method 368
22.23. Application of Wiener's general Tauberian theorem . . 371
22.34. A more general Tauberian theorem 372
22.35. The case $\alpha = 3, \beta = 1$ 374
22.36. The case $\alpha = 5, \beta = 3$ 377
22.37–38. Another Tauberian theorem 378
