Introduction 1

Chapter I. General representations of the solutions of second order linear differential equations of the elliptic type in two independent variables 3

1. Fundamental concepts, terms and notation 3
2. Second order linear elliptic differential equations in canonical form. Reduction to their normal form 6
3. Integral equations of the Volterra type in the complex domain 11
4. The Riemann function of the equation (E_0) 16
5. Some special examples 19
6. Analytic solutions of the equation (E_0). Solution of Goursat's problem 22
7. Elementary solutions 27
8. Analytic nature of the solutions of the equation (E_0) 30
9. Analytic continuation of the solutions of the equation (E_0) into the domain of complex values of the arguments 32
10. General representations of solutions of the equation (E_0) in simply-connected domains 35
11. General representations of all the solutions of the equation (E_0) in multiply-connected domains 45
12. Equations with real coefficients 54
13. General representations of the solutions of the equation $\Delta u + \lambda^2 u = 0$ 57
14. General representations of the solutions of the equation $(1+x^2+y^2)^2\Delta u + 4n(n+1)u = 0$ 61
15. Systems of equations of the first order with analytic coefficients 64

Chapter II. Expansions and approximations of solutions of the equation (E_0) 84

16. Some definitions and auxiliary theorems 84
17. Expansions of approximations of solutions of the equation (E_0) in a simply-connected domain 88
18. Expansions of solutions of the equation (E_0) in a circle 91

19. Addition formulae for the Riemann function and the standard elementary solution 95
20. Expansions of solutions of the equation (E_0) in a series in a circular annulus 99
21. Approximation of solutions of the equation (E_0) in a multiply-connected domain 101
22. Applications to the theory of Bessel functions 103
23. Applications to the theory of Legendre functions 110

Chapter III. Boundary value problems 120

24. General statement of boundary value problems 120
25. Solution of problem D for a simply-connected domain 122
26. Criteria for solubility of problem D 133
27. Solution of problem D for a multiply-connected domain. Green's function 137
28. Solution of problem A in the case of a simply-connected domain 145
29. Solution of problem A for the case of a multiply-connected domain. 154
30. Approximation of solutions of the equation (E_0) in a closed domain. Expansion of an arbitrary function into a series of particular solutions of (E_0) on a contour 155

Chapter IV. General representations of solutions of a system of second order elliptic differential equations and their applications 159

31. Matrix form of system (S_0). Adjoint system. Riemann matrix function 159
32. Elementary solutions. Analytic nature of the solutions of system (S_0) 164
33. General representations of regular solutions of the system (S_0) 167
34. Notes on the solution of boundary value problems for the system of equations (S_0) 169

Chapter V. General representations of solutions of a class of higher order elliptic differential equations and their applications 174

I. General representations of solutions of equation (M) 175

35. General representations of solutions of the equation $\Delta^n u = 0$ 175
36. Elementary solutions and Green's function of the equation $\Delta^n u = 0$ 181
37. General representations of solutions of the equation (M_0) 184

38. Elementary solutions 193
39. Equation with constant coefficients 196
40. Particular example 203
41. Expansion and approximation of solutions of the equation (M_0) 209

II. Boundary value problems 212

42. Boundary value problem B 212
43. Integral form of the boundary conditions 214
44. Reduction of the boundary value problem B to integral equations 216
45. Problem B for the equation $\Delta^n u = 0$. Uniqueness theorem 225
46. A new integral equation for problem B in the general case 225
47. Solution of problem B for the equation $\Delta^n u = 0$ in the case of a circle. Green's function for a circular domain 226

Chapter VI. Applications to the theory of elasticity 229

I. The plane problem of the stationary vibrations of an elastic cylinder 229

48. General representations of solutions of the equations of the plane problem 229
49. General expressions for the components of the displacement in terms of holomorphic functions 231
50. Solution of boundary value problems for a circular domain 234
51. Solution of boundary value problems for a circular annulus 237
52. Solution of the first fundamental boundary value problem by the method of integral equations 239
53. Solution of the second fundamental boundary value problem by the method of integral equations 243

II. Bending of thin plates 247

54. Fundamental differential equations of the bending of plates 247
55. General solution of the fundamental differential equations 249
56. Notes on boundary value problems 253

III. Applications to the theory of a thin spherical shell 254

57. System of differential equations for a thin spherical shell 255
58. General solution of the system (57.15)-(57.21) 258
59. Alternative expressions for the stresses, moments and displacement components 262
60. General representation of the displacement components u, v, w in terms of analytic functions of a complex variable 265
61. Solution of the boundary value problem when the shell is a spherical segment with a fixed edge 267

62. Shallow spherical shell 271
63. Solution of the boundary value problem in the case of a shallow shell consisting of a spherical segment with a fixed edge 274

IV. Application to the theory of shallow elastic shells 276

64. Fundamental system of equations 276
65. Reduction of equation (64.5) to a Volterra integral equation in the complex domain 277
66. Spherical and cylindrical shells 281

Appendix I. Representation of the solutions of the equation (E_0) with the aid of Green's function, and their behaviour in closed domains 284

Appendix II. Metaharmonic functions 291

I. Some fundamental properties of metaharmonic functions 292

1. Elementary solutions of the equation (M) 292
2. Green's formulae. The Sommerfeld conditions 296
3. Hyperspherical functions. Expansions of metaharmonic functions 302
4. Dirichlet and Neumann problems for the equation (M) 315

II. Some fundamental properties of solutions of equation (A) 339

5. General representation of the solutions of equation (A) 339
6. Riquier's boundary value problem for the equation (A) 347
