THE AUTHORS' PREFACE	xvii
THE TRANSLATORS' AND EDITORS' PREFACE	xix

Chapter I

GENERAL INTRODUCTION	1
§1 Fredholm and Volterra equations	1
1.1 Fredholm equations	1
1.2 Equations with a weak singularity	6
1.3 Volterra equations	6
§2 Other classes of integral equations	8
2.1 Equations with convolution kernels	8
2.2 The Wiener-Hopf equations	9
2.3 Dual equations	9
2.4 Integral transforms	10
2.5 Singular integral equations	11
2.6 Non-linear integral equations	12
§3 Some inversion formulas	14
3.1 The inversion of integral transforms	15
3.2 Inversion formulas for equations with convolution kernels	17
3.3 Volterra's equations with one independent variable and a convolution kernel	20
3.4 The Abel equation	20
3.5 Integral equations with kernels defined by hypergeometric functions	22

Chapter II

THE FREDHOLM THEORY	26
§1 Basic concepts and the Fredholm theorems	26
1.1 Basic concepts	26
1.2 The basic theorems	31
§2 The solution of Fredholm equations: The method of successive approximation	33

2.1	The construction of approximations: The Neumann series	33
2.2	The resolvent kernel	35
§3	The solution of Fredholm equations: Degenerate equations and the general case	37
3.1	Equations with degenerate kernels	37
3.2	The general case	40
§4	The Fredholm resolvent	43
4.1	The Fredholm resolvent	43
4.2	Properties of the resolvent	44
§5	The solution of Fredholm equations: The Fredholm series	44
5.1	The Fredholm series. Fredholm determinants and minors	45
5.2	The representation of the eigenfunctions of a kernel in terms of the minors of Fredholm	47
§6	Equations with a weak singularity	48
6.1	Boundedness of the integral operator with a weak singularity	48
6.2	Iteration of a kernel with a weak singularity	49
6.3	The method of successive approximation	49
§7	Systems of integral equations	50
7.1	The vector form for systems of integral equations	50
7.2	Methods of solution for Fredholm kernels	50
7.3	Methods of solution for kernels with a weak singularity	51
§8	The structure of the resolvent in the neighbourhood of a characteristic value	51
8.1	Orthogonal kernels	51
8.2	The principal kernels	52
8.3	The canonical kernels	53
§9	The rate of growth of eigenvalues	54
 Chapter III		
SYMMETRIC EQUATIONS		57
§1	Basic properties	57
1.1	Symmetric kernels	57
1.2	Basic theorems connected with symmetric kernels	58
1.3	Systems of characteristic values and eigenfunctions	58
1.4	Orthogonalization	58
§2	The Hilbert-Schmidt series and its properties	59
2.1	Hilbert-Schmidt theorem	59
2.2	The solution of symmetric integral equations	60

2.3	The resolvent of a symmetric kernel	60
2.4	The bilinear series of a kernel and its iterations	61
§3	The classification of symmetric kernels	62
§4	Extremal properties of characteristic values and eigenfunctions	62
§5	Schmidt kernels and bilinear series for non-symmetric kernels	64
§6	The solution of integral equations of the first kind	65
6.1	Symmetric equations	65
6.2	Non-symmetric equations	66

Chapter IV

INTEGRAL EQUATIONS WITH NON-NEGATIVE KERNELS	68
§1 Positive eigenvalues	68
1.1 The formulation of the problem	68
1.2 The kernels to be examined	68
1.3 Existence of a positive eigenfunction	71
1.4 The comparison of positive eigenvalues with other eigenvalues	71
1.5 The multiplicity of the positive eigenvalue	71
1.6 Stochastic kernels	72
1.7 Notes	73
§2 Positive solutions of the non-homogeneous equation	73
2.1 Existence of a positive solution	73
2.2 Convergence of successive approximations	75
2.3 Note	75
§3 Estimates for the spectral radius	75
3.1 Formulation of the problem	75
3.2 Upper estimates	76
3.3 The general method	77
3.4 The block method	78
3.5 Supplementary notes	79
§4 Oscillating kernels	80
4.1 The formulation of the problem	80
4.2 Oscillating matrices	80
4.3 Vibrations of an elastic continuum with a discrete distribution of mass	81
4.4 Oscillating kernels	83
4.5 Small vibrations of systems with infinite degrees of freedom	84

Chapter V	
CONTINUOUS AND COMPACT LINEAR OPERATORS	86
§1 Continuity and compactness for linear integral operators	87
1.1 The formulation of the problem	87
1.2 Linear integral operators with their range in C	90
1.3 General properties of integral operators in the L_p -spaces	92
1.4 L -characteristics of linear integral operators	94
1.5 Linear U -bounded operators	95
1.6 Linear U -cobounded operators	97
1.7 Theorems with two conditions	98
1.8 A subtle continuity and compactness condition	101
1.9 Some particular classes of integral operators	102
1.10 Additional notes	104
§2 Equations of the second kind. The resolvent of an integral operator	105
2.1 The formulation of the problem	105
2.2 The resolvent of a linear operator and the spectrum	106
2.3 The space of kernels	108
2.4 The resolvent of a linear integral operator	109
2.5 The resolvent of 'improving' operators	111
2.6 Conditions for unique solvability	111
2.7 Equations with iterated kernels	112
2.8 The conjugate equation	113
2.9 Supplementary notes	114
§3 Equations of the second kind with compact operators in a Banach space	115
3.1 The formulation of the problem	115
3.2 The spectrum of a compact operator	115
3.3 The splitting of compact operators	117
3.4 The spectrum of a compact integral operator	119
3.5 Fredholm theorems	121
3.6 The resolvent of a compact operator	122
3.7 Equations with improving operators	123
3.8 Supplementary notes	124
§4 Equations of the second kind with compact operators in a Hilbert space	124
4.1 Preliminary notes	124
4.2 Equations with self-adjoint operators	125
4.3 The resolvent and the spectrum of a self-adjoint integral operator	126

4.4	Hilbert-Schmidt operators	128
4.5	Mercer operators	130
4.6	Self-adjoint operators with their range in a Banach space	131
4.7	Positive definite self-adjoint operators	132
4.8	Hilbert-Schmidt decomposition for compact operators	134
§5	Positive operators	136
5.1	Semi-ordered spaces	136
5.2	General theorems relating to positive operators	136
5.3	Estimates for the spectral radius	137
5.4	The non-homogeneous equation	138
5.5	Existence of an eigenvector	139
5.6	Properties of the eigenvalue $\rho(K)$	139
5.7	Eigenvalues of the conjugate operator	140
5.8	Operators which leave a miniedral cone invariant	140
§6	Volterra equations of the second kind	142
6.1	The formulation of the problem	142
6.2	Basic theorems	142
6.3	Supplementary notes	143
§7	Equations of the first kind	144
7.1	The formulation of the problem	144
7.2	Equations in Hilbert space	144
7.3	The regularization method	145

Chapter VI		
ONE-DIMENSIONAL SINGULAR EQUATIONS		149
§1	Basic notions	149
1.1	The singular integral	149
1.2	The singular Cauchy integral	153
1.3	The singular Hilbert integral	154
§2	Some properties of singular integrals	154
2.1	Assumptions about the contour	154
2.2	On the existence of singular Cauchy integrals	155
2.3	Limit formulas	155
2.4	Integration by parts	157
2.5	The distortion of the removed arc	158
2.6	Change of variable	158
§3	Singular operators in functional spaces	158
3.1	The singular operator	158

3.2	Invariant spaces	159
3.3	Non-Liapunov contours	160
3.4	Further theorems about invariant spaces	161
§4	Differentiation and integration formulas involving singular integrals	162
4.1	Differentiation formulas	162
4.2	Integration formulas	163
§5	Regularization	164
5.1	Right and left regularization	164
5.2	The index of an operator	165
§6	Closed contours; symbols; Nöther theorems	167
6.1	The general singular operator	167
6.2	The symbol of a singular operator	168
6.3	Nöther theorems	169
6.4	Singular equations with Hilbert kernels	170
6.5	Supplementary notes	171
§7	The Carleman method for a closed contour	172
7.1	Reduction of a singular equation to a boundary value problem	172
7.2	The solution of the boundary value problem	174
§8	Systems of singular equations defined on a closed contour	182
8.1	The singular operator of a system	182
8.2	The symbol	182
8.3	Nöther theorems	183
§9	The open contour case	188
9.1	Example	188
9.2	The general case	190
9.3	Supplementary notes	193
§10	Tricomi and Gellerstedt equations	194
10.1	The formulation of the problem	194
10.2	Reduction to a boundary value problem	195
10.3	Solution of the homogeneous problem	197
10.4	Solution of the non-homogeneous problem	197
§11	Equations with degenerate symbol	199
11.1	Unbounded regularization	199
11.2	The general singular equation	199
11.3	Systems of singular equations	201
§12	Singular equations in generalized function spaces	202
12.1	Equations with a non-degenerate symbol	203
12.2	Equations with a degenerate symbol	204

Chapter VII		
THE INTEGRAL EQUATIONS OF MATHEMATICAL PHYSICS		205
§1	The integral equations of potential theory	205
1.1	The integral equations of the Dirichlet and Neumann problems, for simply connected boundaries	205
1.2	The Robin problem	210
1.3	The external Dirichlet problem	211
1.4	The case of a disconnected boundary	212
1.5	Mixed problems in potential theory	214
1.6	The distribution of the characteristic values of the integral equations of potential theory	215
1.7	Extension to multi-dimensional spaces	215
§2	The application of complex variable to the problems of potential theory in plane regions	217
2.1	Dirichlet's problem for a simply connected plane region	217
2.2	Dirichlet's problem for multi-connected regions	219
2.3	The Neumann problem	222
2.4	The conformal mapping of multi-connected regions	224
2.5	The Green's function and the Schwarz kernel	224
§3	The biharmonic equation and the plane problem in the theory of elasticity	227
3.1	The application of Green's function. The formulation and the study of the plane problem of the theory of elasticity	227
3.2	Simply connected regions	230
3.3	Application of Cauchy-type integrals. Muskhelishvili's equations	230
3.4	Lauricella-Sherman equations	232
3.5	Periodic problem of the theory of elasticity	233
3.6	The characteristic values of the integral equations of the theory of elasticity	234
§4	Potentials for the heat conduction equation	235
4.1	Integral equations for heat conduction	235
4.2	An examination of the integral equations of heat potentials and the convergence of the method of successive approximations	239
§5	The generalized Schwarz algorithm	240
5.1	The general formulation and the convergence of the algorithm for the plane problem of potential theory	240

5.2	Application to three-dimensional problems	244
5.3	Applications to the theory of elasticity	245
§6	Application of the theory of symmetric integral equations	247
6.1	The Sturm-Liouville problem	247
6.2	The fundamental vibrations of a string	249
6.3	The stability of a rod under compression	250
6.4	The fundamental vibrations of a membrane	251
6.5	The pressure of a rigid stamp on an elastic half-space	252
§7	Certain applications of singular integral equations	254
7.1	Mixed problem of potential theory	254
7.2	Mixed problems in the half-plane	255
7.3	The problem of two elastic half-planes in contact	256
7.4	The pressure of a rigid stamp on an elastic half-plane	257
7.5	The mixed problem of the theory of elasticity	258
7.6	The problem of flow past an arc of given shape	261
 Chapter VIII		
INTEGRAL EQUATIONS WITH CONVOLUTION KERNELS		263
§1	General introduction	263
1.1	The basic equation and special cases	263
1.2	The symbol. Conditions for normal solvability	265
1.3	Equations with elementary solutions	266
1.4	Equations which reduce to the form (8.1)	270
1.5	Function spaces	271
§2	Examples	273
2.1	The basic problem of the theory of radiation	273
2.2	The problem of linear smoothing and forecasting	274
2.3	The electromagnetic coastal effect	275
2.4	A problem in the theory of hereditary elasticity	275
2.5	The potential of a conducting disk	275
§3	Equations defined on a semi-infinite interval with summable kernels	276
3.1	The solvability conditions	276
3.2	Factorization	278
3.3	Solution of the non-homogeneous equation	280
3.4	Solution of the homogeneous equation	282
§4	Dual equations with summable kernels and their adjoints	283
4.1	Reduction of the dual equation to an equivalent equation defined on a semi-infinite interval	283
4.2	The formula for the index and properties of the basis for the solutions of the homogeneous equation	284

	4.3 The equation adjoint to the dual	285
§5	Examples	286
§6	Dual equations with kernels of exponential type	291
	6.1 Reduction to a boundary value problem	291
	6.2 Case 1	293
	6.3 Case 2	295
§7	The Wiener-Hopf method	298
	7.1 A description of the method	298
	7.2 The reduction of (8.14) to a boundary value problem	299
	7.3 An example	300
§8	Equations with degenerate symbol	301
	8.1 The Riemann problem	301
	8.2 The Wiener-Hopf equation of the second kind	304
	8.3 The Wiener-Hopf equation of the first kind	305
	8.4 The dual equation of the second kind	306
§9	Examples	308
§10	Systems of equations on a semi-infinite interval	312
	10.1 The basic assumptions	312
	10.2 Factorization of matrix-functions	314
	10.3 The solvability conditions	315
	10.4 Dual equations	317
	10.5 Kernels with an exponential decay at infinity	319
§11	Equations defined on a finite interval	320
	11.1 Reduction to a boundary value problem	321
	11.2 Kernels with rational Fourier transforms	321
	11.3 Reduction to a differential equation with constant coefficients	322
	11.4 Eigenvalues	323
Chapter IX		
MULTIDIMENSIONAL SINGULAR EQUATIONS		
§1	Basic concepts and theorems	329
	1.1 Notations	329
	1.2 The singular integral	330
	1.3 Existence conditions for singular integrals	331
§2	The symbol	333
	2.1 The singular operator	333
	2.2 The symbol of a singular operator	334
	2.3 Formulas for the determination of the symbol	334
	2.4 Some new concepts	336

2.5	Variation in the symbol with respect to changes in the independent variables	337
2.6	An integral representation for the operator A in terms of its symbol	337
§3	Singular operators in $L_p(E_m)$	338
3.1	Boundedness conditions for singular operators	338
3.2	The decomposition of the simplest singular operator into a series	340
3.3	The multiplication rule for symbols	341
3.4	The operator conjugate to a singular operator	341
§4	Singular integrals over a manifold	341
4.1	The definition of a singular operator and its symbol	341
4.2	Another definition for the singular operator	343
§5	Regularization and Fredholm theorems	343
§6	Systems of singular equations	344
6.1	Matrix singular operators	344
6.2	The symbol matrix	345
6.3	The index	345
§7	Singular equations in Lipschitz spaces	348
§8	Singular equations on a cylinder	350
§9	Singular equations in spaces of generalized functions	352
§10	Equations with degenerate symbol	354
§11	Singular integro-differential equations	356
§12	Singular equations on a manifold with boundary	357
Chapter X		
NON-LINEAR INTEGRAL EQUATIONS		360
§1	Non-linear integral operators	360
1.1	The basic concepts of the theory of non-linear operators	360
1.2	Urison operators with their range in the space C	363
1.3	Hammerstein operators with range in L_q	366
1.4	The continuity of Urison operators with range in L_q	368
1.5	The complete continuity of Urison operators with range in L_q	370
1.6	Some special conditions	370
1.7	Operators with range in L_∞	371
1.8	Continuity and complete continuity for other types of integral operators	373
1.9	Derivatives of non-linear operators	374
1.10	Derivatives of the Hammerstein operator	375

1.11	Auxiliary theorems about superposition operators	378
1.12	The differentiability of Urison operators	382
1.13	Continuous differentiability of Urison operators	383
1.14	Higher order derivatives	383
1.15	Analytic operators	384
1.16	Asymptotically linear operators	385
1.17	Supplementary notes	388
§2	The existence and uniqueness of solutions	388
2.1	The formulation of the problem	388
2.2	Equations with operators satisfying a Lipschitz condition	389
2.3	Equations with completely continuous operators	391
2.4	The use of upper estimates	393
2.5	Equations with asymptotically linear operators	393
2.6	Variational methods	394
2.7	The existence of non-zero solutions	397
2.8	The existence of a positive solution	398
2.9	Equations with concave non-linearities	400
2.10	Equations with a parameter	401
2.11	Supplementary notes	404
§3	The extension and bifurcation of solutions of non-linear integral equations	404
3.1	The formulation of the problem	404
3.2	The basic theorem for implicit functions	405
3.3	Differential properties of an implicit function	406
3.4	The analyticity of solutions	410
3.5	The bifurcation equation	411
3.6	The Nekrasov-Nazarov method	413
3.7	The bifurcation points	416
3.8	Supplementary notes about bifurcation points	419
