

CONTENTS

Preface	vii
Chapter 1. Introduction and Microbalance Review, A.W. Czanderna and S.P. Wolsky	1
I. Introduction	1
II. History	4
III. Definitions	5
IV. Classifications of various types of microbalances	7
A. Introduction: the ideal microbalance	7
B. Types of instruments	8
1. Cantilever microbalances, 8 — 2. Spring microbalances, 9 — 3. Beam microbalances, 12	
C. Methods of monitoring mass changes	17
1. Deflection operation, manual or automatic, 17 — 2. Null operation, manual or automatic compensation, 17	
D. Methods for automatic sensing of movement from the null point	19
1. Introduction: automatic recording microbalances, 19 — 2. Capacitance, 23 — 3. Magnetic induction, 24 — 4. Photoelectric, 24	
E. Materials for microbalance fabrication	24
F. Conclusion: the ultimate microbalance	25
V. Calibration techniques	26
VI. Auxiliary equipment for operation of a vacuum microbalance	27
A. Introduction	27
B. Vacuum operation	28
1. Balance housing, 28 — 2. Hangdown tubes, 28 — 3. Sample suspension fibers, 29 — 4. Vacuum technique, 30	
C. Vibrational mounts	30
D. Thermostatic operation	32
E. Automatic operation	32
F. Manual operation	32
G. High temperature operation	32
H. Low temperature operation	34
VII. Undesirable disturbances or forces	34
A. Adsorption and desorption effects	34
B. Temperature fluctuations	35
C. Static charge forces	36
D. Convection currents	36
E. Buoyancy forces	37
F. Radiometric forces that result from the thermomolecular flow of gases	38
G. Water vapor effects	42
VIII. Applications	43
A. Classic operation	43
B. Simultaneous measurement of mass and other physical parameters	46
C. Future	49
D. Thermogravimetry	50
Acknowledgments	50
References	51

Chapter 2. Beam Microbalance Design, Construction and Operation,	
R.L. Schwoebel	59
I. Introduction	59
II. Some general theoretical considerations in beam microbalance design	60
III. Microbalance selection considerations	69
A. Environmental and experimental considerations	69
B. Advantages and disadvantages of various beam microbalances	70
1. Horizontal suspensions, 70 — 2. Pivotal suspensions, 71 — 3. Vertical suspensions, 71	
IV. Microbalance construction	74
A. Materials considerations	74
B. Beam and suspension construction	76
V. Microbalance operation	81
A. Deflection detectors	81
B. Compensation and null techniques	82
C. Automatic damping and nulling systems	84
D. System sensibility or resolution	87
E. Microbalance calibration	89
VI. Summary	91
References	92
Chapter 3. Sources of Error in Microweighing in Controlled Environments,	
C.H. Massen and J.A. Poulis	95
I. Introduction	95
II. Brownian motion	96
A. The undamped balance without feedback	96
B. The critically damped balance without feedback	97
C. The automated balance	98
III. Knudsen forces	100
IV. Cavity forces	111
V. Armlength effect	113
VI. Radiation pressure	116
VII. Gravitational forces	117
VIII. Electrostatic forces	118
IX. Magnetostatic forces	120
X. Building vibrations	124
References	124
Chapter 4. Physical Adsorption Studies with the Vacuum Microbalance,	
E. Robens	127
I. Introduction	127
II. Instrumentation	129
A. Sorption balances	129
B. Instruments for pressure measurement and control	131
C. Instruments for temperature measurement and control	132
D. Determination of the saturation vapor pressure	135
E. Gravimetric sorption measuring instruments	135
1. Moisture meters, 135 — 2. Thermogravimetric instruments, 135 — 3. Sorption meters, 135 — 4. Composite instruments, 136	
III. Measuring techniques	137
A. Measuring procedure	137
1. Thermogravimetric analysis, 138 — 2. Nitrogen sorption isotherm, 138	
B. Pretreatment of the materials	139
1. Sample preparation, 139 — 2. Adsorptives, 140	
C. Pretreatment of the instrument	141
1. Balance, 141 — 2. Thermostatting, 141 — 3. Buoyancy compensation, 141 — 4. Gas supply, 141	

	D. Special recommendations for the measurements	143
	1. Safety measures, 143 — 2. Errors, 143 — 3. Buoyancy, 143 — 4. Degassing, 146 — 5. Zero point determination, 147 — 6. Condensation value determination, 148 — 7. Knudsen forces and convection, 149 — 8. Electrostatic charge, 149 — 9. Electromagnetic fields, 150 — 10. Temperature failures, 150	
	E. Reducing the measuring time	151
IV.	Examples of physisorption measurements and their evaluation	153
	A. Evaluation of adsorption isotherms	153
	1. Representation of sorption isotherms, 153 — 2. Phenomenology, classification of isotherms, 153 — 3. Interpretation of physisorption isotherms, 155 — 4. Cross-sectional area of adsorbed molecules, 155 — 5. Computer program for surface area and pore size analysis, 156	
	B. Determination of specific surface area, particle size and roughness	156
	1. B point, 158 — 2. BET method, 159 — 3. Comparison methods, 160 — 4. Cumulative method, 162	
	C. Isotherms of porous materials	163
	1. Pore width, 163 — 2. Porosity and mean pore radius, 164	
	D. Mesopore analysis	164
	1. Assessment of pore structure from isotherm shape, 164 — 2. Kelvin equation, 165 — 3. Comparison methods, 166 — 4. Thickness of adsorbed layers, 166 — 5. The "modelless" method, 167	
	E. Micropore analysis	169
	F. Determination of the isosteric heat	170
	References	171
Chapter 5. Chemisorption Studies with the Vacuum Microbalance,		
	A.W. Czanderna	175
I.	Introduction	175
II.	Probing the surface phase	177
III.	Quantitative information from adsorption and desorption	181
	A. Adsorption parameters	181
	B. Isosteric heat of adsorption	182
	C. Activation energy of adsorption	183
	D. Desorption kinetics	185
IV.	Experimental	187
	A. Overview	187
	B. Apparatus	189
	C. Technique	190
	1. General comments on buoyancy, 190 — 2. Measurement of the surface area by the BET method, 194 — 3. Measurement of the rate and amount of chemisorption, 197 — 4. Measurement of the amount of outgassing, desorption, and thermal desorption, 198	
V.	Chemisorption results obtained on silver powders	201
	A. The effectiveness of outgassing, oxygen adsorption, and chemical reduction for cleaning the surface and producing reproducible chemisorptive behavior	201
	1. Outgassing properties, 202 — 2. Purification of the surface, 203 — 3. Changes in the surface area, 204 — 4. Changes in the amount of adsorption, desorption, reduction, and sample mass, 204 — 5. Changes in the initial rate of reduction, 205 — 6. On the chemisorption of reducing gases or product gases of the reduction, 206 — 7. On the poisoning of the cleaned surface by bulk diffusion, 207	
	B. Adsorption and desorption of oxygen on silver	208
	1. Equilibrium adsorption, 208 — 2. Adsorption kinetics, 211 — 3. Desorption kinetics, 212 — 4. Nature of adsorbed species, 216	
	C. Adsorption of carbon dioxide on oxygen covered silver	217
VI.	Chemisorption results obtained on other solids	220
VII.	Concluding remarks	228
	Acknowledgments	229
	References	230

Chapter 6. Simultaneous Microgravimetric and Residual Gas Analyzer Measurements,	
W. Kollen and R. Vasofsky	233
I. Introduction	233
II. Instrumentation	234
A. Mass spectrometers	234
1. Residual gas analyzers, 234 — 2. Medium and high resolution instruments, 236	
B. Microbalances	236
III. Experimental	237
A. System design	237
1. Ultimate pressure, 238 — 2. Location of the residual gas analyzer, 239 — 3. Vacuum, 242 — 4. Data handling, 244	
B. Methods	244
1. Residual gas analyzer measurements, 244 — 2. Simultaneous gravimetric-residual gas measurements, 249	
IV. Applications	254
A. Review	255
1. Gas composition, 255 — 2. Desorption and outgassing, 255 — 3. Catalysis, 256 — 4. Thermal gravimetric-mass spectrometric analysis, 257	
B. Future applications	258
Acknowledgments	259
References	259
Chapter 7. The Simultaneous Measurement of Mass Change and Infrared Spectra,	
C.L. Angell	261
I. Introduction	261
II. Experimental	266
III. Results	269
IV. Conclusion	279
References	279
Chapter 8. Microgravimetric Studies of Catalysts and Catalytic Processes,	
E.L. Fuller, Jr.	281
I. Introduction	281
II. Vacuum microbalances	282
A. Equipment and apparatus	282
B. Assembly and operation	285
III. Selected examples	288
A. Surface area determination: variation with pretreatment	289
B. Surface area determination: mixed physical and chemical adsorption	295
C. Chemisorption: Rehydration	297
D. Support information: heat of adsorption from heat of wetting	299
E. Sorption energetics and mechanism: lunar soils	300
IV. Areas of additional research	305
V. Conclusions	306
Acknowledgments	306
References	307
Chapter 9. High Temperature Reaction Studies,	
E.A. Gulbransen and F.A. Brassart	309
I. Introduction	309
A. Types of chemical reactions	309
B. Purpose of chapter	311
C. Preliminary thermochemical analyses	312
D. Extent of reaction	315

	E. Units	316
II.	Empirical and theoretical rate laws	316
	A. General	316
III.	Apparatus and methods	317
	A. Static reaction systems	319
	B. Flow reaction systems	322
	C. Special problems	322
	1. Temperature, 322 — 2. Gas flow, 324 — 3. Pressure, 324 — 4. Conclusions, 324	
IV.	Applications	324
	A. Vapor pressure of silicon	324
	1. Experimental, 325 — 2. Results and discussion, 325	
	B. Oxidation of graphite using the static reaction system	327
	1. Effect of time and temperature, 327 — 2. Chemically controlled region of oxidation, 329 — 3. Gas diffusion region of oxidation, 329 — 4. Capability factor for reaction systems, 334 — 5. Explanation of surface area effect, 335	
	C. Oxidation of graphite using the flow reaction system	336
	1. Effect of gas flow, 336 — 2. Efficiency calculations, 337 — 3. Activated state theory of surface reactions, 338	
	D. Oxidation of molybdenum-static reaction system	340
	1. Oxidation processes, 340 — 2. Effect of temperature, 344 — 3. Effect of pressure, 346 — 4. Classification of oxidation phenomena, 346 — 5. Transition between chemically controlled oxidation and gas diffusion controlled oxidation, 347 — 6. Kinetic efficiency calculations, 348 — 7. Calculation of effective collision number, n , 349 — 8. Mechanism of reaction, 349	
	E. Oxidation of tungsten	351
V.	General comments	352
VI.	Appendix 1: theory of surface interface reactions with no oxides present	353
	A. Processes	353
	B. Kinetic theory	353
	C. Absolute reaction rate theory	354
	1. Mobile adsorption, 355 — 2. Desorption of CO, 355 — 3. Desorption of CO with diffusion, 356	
VII.	Appendix 2: furnaces for temperatures up to 1650°C	356
	A. Mechanical and physical properties of molybdenum disilicide elements	357
	B. Electrical supply equipment	357
	C. Useful life	357
	D. Atmospheric effects	357
	E. Furnace design: refractories	358
VIII.	Appendix 3: furnace tubes and reaction systems	360
	A. Criteria of furnace tube performance	360
	B. Types of furnace tubes	361
	C. Specimen supporting wires	362
	References	363
Chapter 10. Unusual Applications of the Vacuum Microbalance,		
	Th. Gast	365
I.	Introduction	365
II.	Permeation of water vapor through plastic membranes	365
	A. Theory of permeation	365
	B. Measurement of permeation	366
III.	Measurement of dust concentration	368
	A. The basic concept of the dust balance	368
	B. Combination of electrostatic precipitation and electromagnetic weighing	369
	C. Mass determination by vibrations of a very thin band	370
IV.	Determination of grain size distributions by weighing	373
	A. Theory of sedimentation analysis	373
	B. Grain size distribution by sedimentation in liquids	374

	C. Grain size distribution by sedimentation in air	375
	D. Grain size distribution by sedimentation in partial vacuum	375
	E. General considerations	376
V.	Measurement of surface tension	377
	A. Basic facts	377
	B. Measurement of surface tension with the aid of wire loops and rings	377
	C. Measurement of surface tension with the aid of an immersed solid plate	378
	D. Measurement of surface tension with the aid of a cylinder or of a solid plate touching the surface	380
	E. Adaptation of the vacuum microbalance to measurement of surface tension	380
VI.	Measurement of permittivity and dielectric loss factor	381
	A. Theory of electrostatic forces on dielectric bodies	381
	B. Measurement of dielectric permittivity	382
	C. Measurement of the dielectric loss factor	383
VII.	Precision measurement of pressure using the principle of automatic compensation	386
	A. Objective of the development	386
	B. A self compensating Bodenstein manometer	386
	1. Compensation of torque, 386 — 2. Torsion measurement from the torque on a ribbon, 387	
VIII.	Simultaneous measurement of components of force and combinations of force and torque	389
	A. Measurement of lift and drag in a gas stream by a two component microbalance	390
	B. Simultaneous determination of mass flow and reaction force of a vapor stream from a heated sample	391
	C. Simultaneous measurement of weight and torque by magnetic suspension	393
IX.	Conclusion	394
	References	395
	Index	397
