FOREWORD	ix
PREFACE	x
CONTENTS OF PREVIOUS VOLUMES	xi

A. The capacitor, its characteristics and its applications in discharge circuits

1. Capacitors in Discharge Circuits in General, Types of Capacitors	1
2. Behavior of Insulators	4
3a. Behavior of Gaseous and Liquid Dielectric Materials	12
3b. High-Voltage Dielectric Fluids	17
4. The Vacuum Capacitor	19
5. Specifying a Spark Discharge or Flash Lamp Capacitor	19
6. Laser Discharge Capacitors	25
7. Pulse Capacitors for Soft- and Hard-Tube Circuits	29
8. Measurements of Ultralow Inductance (nH) Capacitors	32
9. High-Voltage, Low-Inductance Capacitors for Marx Circuits	45
10. The Parallel Plate Capacitors for Superposed Frequencies	47
11. Big Electrolytic Capacitor Banks	49
12. Tantalum Capacitors	50

B. Switching means

1. Controlled Gas Discharge Tubes	52
2. Controlled Semiconductor Switches	61
3. Push-Pull Switching Circuits for Rectangular Pulses	63
4. Modern High Power Switching Gaps	69
5. Liquid and Solid Gaps	74
6. High-Voltage Vacuum Contactors	75
7. The Lightning Protectors	80
8. Laser-Controlled Spark Gaps	84
9. Quenched Spark Gaps	88
10. Crowbar Switches	93
11. Other Unusual Switching Gaps	95

C. Line conductors

1. The Influence of Impedance and Its Transformation by Connecting Lines	113
2. The Coaxial Low-Impedance Water Line and the CuSO_4 Output Resistor	122

D. Conversion of capacitor energy into current impulses

- | | |
|-----------------------------------------------------------------------------------------------------------|-----|
| 1. Direct Discharge through a Conductor | 126 |
| 2. Transformed Discharges for Highest Currents at Low Voltage | 142 |
| 3. Subnanosecond Pulse Generators | 144 |
| 4. Inductive Energy Storage Systems Applied to Extend the Duration of Current Pulses from Capacitor Banks | 145 |

E. Conversion of capacitor energy into voltage impulses and its practical applications

- | | |
|-----------------------------------------------------------------------------------------------------------------------------------|-----|
| 1. Very Fast Voltage Pulse Generators for Scientific Applications | 154 |
| 2. Kerr Cell and Pockels Cell Pulsers and Related Techniques | 165 |
| 3. Pulsers for Laser Excitation and Flash Photolysis | 180 |
| 4. High Voltage Pulse Transformers and their Application to Spark Tracing (Aerodynamics) and to X Ray, Electron, and Light Pulses | 200 |
| 5. Megavolt Pulse Techniques: Lightning Flash and EMP Simulation | 215 |

F. Conversion of capacitor energy into x-ray flashes and beams of electrons, ions, and neutrons

- | | |
|----------------------------------------------------------------------------------------------------|-----|
| 1. New Methods for Generating X-Ray Flashes (Debye-Scherrer and Laue Patterns, Plasmas and Lasers) | 229 |
| 2. New Designs and Applications of X-Ray Flash Equipment for Motion Analysis | 241 |
| 3. Hard X-Ray (Gamma-Ray) Flashes and Electron Beam Pulses of High Energy | 279 |
| 4. High-Energy Ion Generation | 288 |
| 5. Neutron Flashes for Material Testing | 292 |

G. Conversion of capacitor energy into heat

- | | |
|--------------------------------------------------------------------------|-----|
| 1. Impulse Welding, Direct Capacitor Discharge | 298 |
| 2. Welding by Transformed Capacitor Energy | 303 |
| 3. Fast Metallic Phase Transformations by Current Pulses | 312 |
| 4. Pulse Hardening of Carbon Steel | 313 |
| 5. Exploding Wires and Their Applications; Exploding Wire Shutters | 320 |
| 6. High Temperature Plasma Generation by High Energy Capacitor Discharge | 328 |
| 7. Plasma Heating by Laser Beam Energy | 337 |

H. Conversion of capacitor energy into magnetic fields

- | | |
|------------------------------------------|-----|
| 1. Pulsed Magnetic Fields, Concentration | 349 |
| 2. Electromagnetic Plasma Propulsion | 355 |

CONTENTS

vii

3. Charging of Permanent Magnets	359
4. Faraday (Magneto-optical) Effect and Its Use	360
5. Capping and Uncapping Shutters	362
6. Magnetically Driven Hypervelocity Macroparticle Accelerators	365
7. Magnetically Driven Gas Accelerators	370
8. Megagauss Fields	371

I. Conversion of capacitive stored energy into acoustic pulses

1. Acoustic Pulses	380
2. Acoustic Pulses and Electroceramics	394
3. Advanced Sonar Techniques	401
4. Underwater Shock Waves from Sparks	409
5. Shock Waves in High Pressure Physics and Metal Forming	420
