

Contents

1. Introduction	1
1.1 Seven Ranks in Electrical and Optical Circuitry	1
1.1.1 Conventional Four Ranks	2
1.1.2 Comparison of Circuit Dimensions	2
1.1.3 Nonconventional Three Ranks	3
1.1.4 Planar Circuits	3
1.1.5 Optical Planar Circuits	5
1.1.6 Long-Waveguide Circuit	5
1.2 Classification and Technical Significance of Planar Circuits	6
1.2.1 Three Basic Structures	6
1.2.2 The Neumann and Dirichlet Problems	7
1.2.3 Technical Significance of the Planar Circuit Concept	8
1.3 History of Planar Circuit Research	8
1.3.1 History of the Earliest Stage	8
1.3.2 History After 1972	9
1.4 History of Optical Planar Circuit Research	9
1.5 Purpose and Organization of This Book	9
2. Analysis of Planar Circuits Having Simple Shapes	10
2.1 Background	10
2.2 Basic Equations	11
2.2.1 Wave Equation	11
2.2.2 Boundary Conditions for Cases when External Ports Are Absent	12
2.2.3 Eigenfunction Expansion	13
2.2.4 A Simple Example of the Solution	14
2.2.5 Boundary Condition at Ports	16
2.3 Derivation of Circuit Characteristics	16
2.3.1 Definition of Terminal Voltage and Current	16
2.3.2 Circuit Characteristics Expressed in Terms of Green's Function	17
2.3.3 Expansion of Green's Function by Eigenfunctions	19
2.4 Examples of Analysis Based on Green's Function	20
2.4.1 Rectangular Circuit	20
2.4.2 Circular Circuit	23

2.4.3	Triangular Circuit	24
2.4.4	Annular Circuit	27
2.4.5	Circular and Annular Sectors	28
2.4.6	Open-Ended Stripline (Comparison with Distributed-Constant Line Theory)	28
2.5	Determination of Equivalent Circuit Parameters Based on Energy Consideration	29
2.6	Equivalent Circuit of a Multiport Planar Circuit	31
2.7	Validity of the Open-Boundary Assumption	32
2.8	Examples of Planar Circuits Having Simple Shapes	33
2.8.1	Circular Resonator	33
2.8.2	Coupled-Mode Filter Using a Single Circular Resonator	35
2.8.3	Planar 3-dB Hybrid Using a Circular Resonator	39
2.9	Summary	42
3.	Analysis of Planar Circuits Having Arbitrary Shapes	43
3.1	Background	43
3.2	Basic Formulation of the Contour-Integral Method	44
3.3	Circuit Parameters of an Equivalent N Port	45
3.4	Transfer Parameters of a Two-Port Circuit	47
3.5	Numerical Computation Procedure	49
3.5.1	Description of Circuit Pattern	49
3.5.2	Computation of r_{ij} and θ_{ij}	50
3.5.3	Computation of Matrix Elements u_{ij} and h_{ij}	51
3.5.4	Computation of Transfer Parameters	51
3.5.5	Computation of Input Admittance and S_{12}	52
3.5.6	RF Voltage Along the Circuit Periphery	53
3.6	Examples of Computer Analysis by the Contour-Integral Method	53
3.6.1	One-Port Circular Circuit	53
3.6.2	Two-Port Circular Circuit	55
3.6.3	Two-Port Square Circuit	58
3.6.4	Irregularly Shaped Circuit	59
3.6.5	Computer Time	59
3.7	Analyses Based on Eigenfunction Expansion	60
3.7.1	Advantages and Disadvantages of Eigenfunction-Expansion Approaches	60
3.7.2	Methods for Solving Eigenvalue Problems	61
3.7.3	Silvester's Theory	62
3.7.4	Solution of an Eigenvalue Problem by Variational Method	63
3.7.5	Rayleigh-Ritz Method	64
3.7.6	Finite-Element Method	65
3.8	Summary	67

4. Short-Boundary Planar Circuits	68
4.1 Background	68
4.2 Principle of Analysis	69
4.3 Short-Boundary Planar Circuit Having Two Coaxial Coupling Ports	70
4.3.1 Basic Equation	70
4.3.2 Simplification of the Basic Equation	72
4.3.3 Derivation of Admittance Parameters	73
4.3.4 Derivation of Transfer Parameters	74
4.4 Short-Boundary Planar Circuit Having Two Waveguide Coupling Ports	75
4.4.1 Basic Equation	75
4.4.2 Simplification of the Basic Equation	76
4.5 Examples of Numerical Analysis	78
4.5.1 Short-Circuited Radial Line	78
4.5.2 Uniform Waveguide Section	80
4.5.3 Waveguide Section Including a Thick Inductive Window .	81
4.5.4 Waveguide Sections Including Corners	83
4.5.5 Waveguide Section Including Post	84
4.6 Higher-Order Mode Consideration at Reference Planes	84
4.7 Summary	86
5. Segmentation Method	87
5.1 Background	87
5.2 Theory of Segmentation Method Using S Matrices	88
5.2.1 Basic Concepts	88
5.2.2 Interface Network	89
5.2.3 Computation of the S Matrix	90
5.2.4 Reduction of Computer Time in S Matrix Computation .	91
5.3 Theory of Segmentation Method Using Z Matrices	93
5.3.1 Basic Equations	93
5.3.2 Computation of the Z Matrix	94
5.3.3 Reduction of Computer Time in Z Matrix Computation .	95
5.4 Summary	96
6. Trial-and-Error Synthesis of Optimum Planar Circuit Pattern	97
6.1 Background	97
6.2 Method of Synthesis	98
6.2.1 Principle of the Method	98
6.2.2 Computer Analysis	99
6.2.3 Starting Circuit Pattern	100
6.2.4 Figure of Merit	100

6.2.5 Variation of Characteristics by Modification of Circuit Pattern	102
6.2.6 Optimum Circuit Pattern	103
6.3 Comparison with Experiment	104
6.4 Computer Time	105
6.5 Summary	105
7. Fully Computer-Oriented Synthesis of Optimum Planar Circuit Pattern	106
7.1 Background	106
7.2 Method of Synthesis	107
7.2.1 Outline of Synthesis Process	107
7.2.2 Analysis of Frequency Characteristics	108
7.2.3 Pattern Variables	108
7.2.4 Evaluation Function	109
7.2.5 Algorithm for Optimization of Circuit Pattern	110
7.3 Parameters and Computational Techniques in an Actual Example of Synthesis	111
7.3.1 Number of Pattern Variables	111
7.3.2 Reduction of Computer Time Taking Advantage of Double Symmetry	111
7.3.3 Number of Sampling Points Along Periphery	112
7.3.4 Parameters in Evaluation Function	112
7.3.5 Relative Widths of External Striplines	112
7.3.6 Assumption of Uniform Current at Ports	113
7.4 Results of Synthesis	113
7.4.1 Process of Optimization	113
7.4.2 Optimized Circuit Patterns	114
7.5 Experimental Verification	114
7.5.1 Circuit Design and Structure	115
7.5.2 Result of Measurement	117
7.6 Further Improvement of Frequency Characteristics by Addition of External Circuits	117
7.6.1 Types of External Circuits	118
7.6.2 Optimization of Parameters	119
7.6.3 Result of Optimization	120
7.6.4 Obtained Frequency Characteristics	120
7.7 Evaluation of the Synthesized Circuit Patterns	121
7.7.1 Comparison of Theory and Experiment	121
7.7.2 Comparison with Other Characteristics	121
7.7.3 Comparison with Other Trials for Synthesizing Planar Circuits	122
7.8 Summary	123

8. Planar Circuits with Anisotropic Spacing Media	124
8.1 Background	124
8.2 Theories of Analysis	125
8.2.1 Basic Equations	125
8.2.2 Analysis Based on Eigenfunction Expansion	127
8.2.3 Analysis Based on a Contour-Integral Equation	128
8.3 Formulations for Numerical Computation and Examples of Calculation	129
8.3.1 Formulation for the Eigenfunction-Expansion Method ..	129
8.3.2 Examples of Calculation	131
8.3.3 Formulation for the Contour-Integral Method	133
8.3.4 Examples of Calculation	135
8.4 Comparison of the Eigenfunction-Expansion and Contour-Integral Methods	137
8.5 Optimum Design of Ferrite Planar Circuits	138
8.5.1 Technical and Historical Backgrounds	138
8.5.2 Method of Numerical Analysis	139
8.5.3 Optimum Design of a Disk-Shaped Circulator	139
8.5.4 Optimum Design of a Triangular Circulator	140
8.5.5 Modified Triangular Circulators Having Curved Sides ...	142
8.6 Summary	144
9. Optical Planar Circuits	145
9.1 Background	145
9.2 Wave-Optics Approach to Optical Planar Circuits	147
9.2.1 Basic Equations	147
9.2.2 TE Modes	148
9.2.3 TM Modes	149
9.2.4 Vertical Field Distributions	150
9.3 Geometrical Optics Approach to Optical Planar Circuits	151
9.3.1 Concepts of Geometrical Optics and Ray	151
9.3.2 Eikonal and Eikonal Equation	151
9.3.3 Ray Equation	152
9.4 Optical Planar Circuits Having Uniform Slab Structure	154
9.4.1 Model to be Considered	154
9.4.2 TE-Mode Waves	154
9.4.3 TM-Mode Waves	156
9.5 Optical Planar Circuits Having Periodic Structures	157
9.5.1 Mathematical Expression of Optical Bloch Waves	157
9.5.2 Dispersion Relation and Group Velocity of Optical Bloch Waves	158
9.5.3 Excitation of Optical Bloch Waves	160
9.5.4 Example of Measured $\beta_z - \beta_x$ Relations	160

9.6 Planar Lenses	161
9.7 Summary	163
10. Optical Planar Circuits Having Stripelike Waveguiding Structures .	164
10.1 Background	164
10.2 Model to be Considered	165
10.3 Geometrical Optics Approach	166
10.3.1 Limitation of Geometrical Optics	166
10.3.2 Propagating Condition	166
10.4 Wave-Optics Approaches	167
10.5 Beam-Propagation Method	168
10.5.1 Principle	168
10.5.2 Numerical Calculations	171
10.5.3 Examples of Calculation Results	171
10.6 Summary	174
Appendix	175
A2.1 Derivation of (2.5)	175
A2.2 Some Characteristics of Eigenvalues and Eigenfunctions	177
A3.1 Weber's Solution Using Cylindrical Waves	178
A3.2 Derivation of (3.1)	180
A3.3 Choice of the Green's Function Used in Contour-Integral Analysis	181
A4.1 Proof of (4.1) for a Multiply Connected Circuit Pattern	185
A5.1 Computational Technique for Combining n Subports to a Single External Port	186
A8.1 Derivation of (8.5, 8)	187
A8.2 Derivation of (8.18, 19)	188
A9.1 Derivation of (9.27)	188
A9.2 Derivation of (9.32, 33)	190
References	191
Subject Index	197
