FOREWORD	<i>vii</i>
PREFACE	<i>ix</i>
ACKNOWLEDGEMENTS	<i>xiii</i>

Chapter 1 Lenses and reflectors 1

Single surface focusing reflectors	3
Two surface focusing reflectors	8
Single surface refracting lenses	15
Two surface lenses	21
The theory of Damien	25
Constrained microwave lenses	30
Wide angle lenses	34
Phase corrected reflectors	41
Translation reflectors	57
Bi-cylindrical reflectors and lenses	65
The general constrained lens	73
Grating reflectors	78
Diffraction focussing	83
Double reflector scanning antennas	85
Shaped beam antennas	91
Graphical design of two-surface systems	98
References	103
Bibliography	106

Chapter 2 Non-uniform media 108

Part 1 Non-homogenous microwave lenses	
Ray optics in non-uniform media	109
Linear media	110
Cylindrically symmetrical media	114
Spherically symmetrical media	119
General theory of focused rays in spherical media	132
The Legendre transform	140
The bending of light rays near the sun	142
Separability in other coordinate systems	144
Spherical shell lenses	146
Parallel plate and geodesic lenses	155

Part 2 Multilayer structures—radomes and electromagnetic windows 160

The single layer transmission matrix	162
The three layer radome	167
Multilayered media—stratified media	178
The generalized transmission matrix for a non-uniform layer	183
References	185
Bibliography	187

Chapter 3 Scalar diffraction theory of the circular aperture 191

The scalar integral transforms	199
Zero order transforms	206
The circle polynomials	207
Transforms of aperture distributions	213
Phase errors	218
Distribution at a focus	223
Asymmetric patterns	228
Transformation of elliptical aperture	231
The microwave axicon	233
The confocal open resonator cavity	240
References	246
Bibliography	248

Chapter 4 The synthesis of far field radiation patterns 253

Symmetrical patterns—method of Webb-Kapteyn	254
Functions described by Maclaurin expansions	258
Expansion of aperture field as a Bessel series	260
Extension of the Webb-Kapteyn method	261
The zoned circular aperture	262
Fourier-Bessel and Dini series	265
Zones of equal width—the Schlömilch series	276
The generalized Schrömilch series—asymmetric patterns	280
Fresnel zone plates	286
References	288
Bibliography	289

Chapter 5 Polarization 292

The polarization ellipse	293
Stokes parameters	296
Jones' vectors	298
Jones' matrices	300
Reflected waves—the cascade matrix	301
Transmission and reception of elliptically polarized waves	304
The Poincaré sphere	305
Applications to microwave antennas	309

Polarization rotators	311
Multiple inclined gratings	313
Polarization twist reflectors	318
Impossible polarizers	322
Bi-vector and quaternion description of polarization	323
References	326
Bibliography	328

Chapter 6 Progress in optics 330

Optical transformation matrices	334
Transformation in two dimensions	336
Bateman's transformations of optical systems	338
Functions of a hypercomplex variable	341
Geometrical optics in four dimensions	345
Summary and conclusion	348
References	350
Bibliography	351

Appendix I

The laws of refraction and reflection	353
Continuous non-homogeneous medium	360
The theorem of Malus and Dupin	361
The eikonal equation	361
Refraction and reflection operators	363
The focal line of a reflector	370
Reflection and refraction at a lossy medium	372
The differential equation of a reflector	373
Abbe sine condition and Herschel's condition	374
Flux density for ray propagation	376
References	378

Appendix II

The circle polynomials	380
Bessel and associated functions, series and integrals	383
Green's functions—particular integrals of the wave equation	387
Quaternions	391
Ray integral in a spherical medium	398
References	401
