CONTENTS

LIST OF SYMBOLS x

1. INTRODUCTION 1

The standard random electrode 1
Common types of electrode 2
Current-voltage curve for a redox system 4
Effect of chemical kinetics 6
References 7

2. THE SIMPLE ROTATING DISC ELECTRODE 8

The hydrodynamics 8
The basic differential equation for transport 11
The boundary conditions 12
The simplifications for a disc electrode 12
The mathematical solution 13
References 16

3. THE COLLECTION EFFICIENCY 17

The ring-disc electrode 17
Definition of $N_0$ 18
Differential equation and boundary conditions 19
Mathematical solution 20
Effect of bulk concentration of intermediate 22
Shielding effect 24
Current-voltage curve at the ring electrode 25
Numerical method of solution 26
References 28

4. NON-UNIFORMITY OF CURRENT DISTRIBUTION ON THE DISC ELECTRODE 29

Introduction 29
Primary current distribution 29
Effect of charge transfer resistance 30
Effect of concentration polarization 32

Condition for uniform current distribution 35
Experimental tests of non-uniform current distribution 36
References 37

5. THE SCHEME OF SQUARES 38

Introduction 38
Two-electron reactions 38
Relative rates of proton and electron transfer 41
The general scheme of squares 45
One square 47
Heterogeneous vs. homogeneous proton transfer 49
Shift in mechanism with potential 54
Shift in mechanism with pH 56
Three-unit square 61
References 72

6. ELECTRODE KINETICS 73

Introduction 73
The Ivanov–Levich equation 73
Split-ring electrode 76
The copper system 78
The indium system 83
The oxygen reaction 84
Reduction of nitro benzene 92
Conclusions 97
References 97

7. TITRATION CURVES 99

Description of titration curve 99
Calculation of titration curve 100
Analysis of experimental results 103
References 108

8. HOMOGENEOUS KINETICS – SECOND ORDER 109

Introduction 109
Qualitative description 109
Mathematical theory 110
The reaction between bromine and allyl alcohol 113
Numerical calculations 118
The reaction between $Br_2$ and As(III) 119
References 121

9. HOMOGENEOUS KINETICS – FIRST ORDER 122

Introduction 122

Mathematical theory 122
Numerical calculations 126
Experimental results 127
Diffusion coefficients 130
The range of measurable rate constants 132
References 133

10. TRANSIENT CURRENTS 134

Introduction 134
Ring transient for galvanostatic step at the disc 136
The Laplace technique 142
Potential step at the disc 146
Adsorption, double-layer charging, and other effects 149
Integration of transients 151
Alternating current transients 153
References 155

APPENDIX 1. Values of $F(\theta)$, $G(\phi)$, and $N_0$ 156

APPENDIX 2. Linked chemical equilibria 158

APPENDIX 3. Heterogeneous vs. homogeneous proton transfer 164

APPENDIX 4. Expressions for $T_2$ in eqn (9.8) 166

APPENDIX 5. Values of $a$, $b$, and $c$ in eqn (9.10) 167

INDEX 171
