

CONTENTS

Preface	5
-------------------	---

Part I

GENERAL PRINCIPLES AND CONCEPTS

<i>Chapter 1 Basic concepts of metrology and measuring techniques.</i>	15
1.1 Physical quantities, units and the SI system	15
1.2 Basic concepts of measuring and measuring systems	18
1.2.1 Measurements as a source of information	18
1.2.2 The structural characteristics of measuring systems	21
1.2.3 Some concepts and information on measurements and measuring systems	23
1.3 Assessing the measurement results	29
1.3.1 Assessment by value	30
1.3.2 Evaluation by frequency (spectral assessment)	36
1.4 Noise and interference (disturbance)	37
<i>Chapter 2 Some basic concepts of computer-aided instrumentation</i>	41
2.1 Introduction	41
2.2 Microprocessors and microcomputers	41
2.2.1 General problems	41
2.2.2 Typical building blocks	44
2.2.3 Problems of microcomputer organisation, application and software	49
2.3 Computing devices and methods, measuring techniques, basic concepts of "intelligent instrumentation"	54
2.3.1 General	54
2.3.2 Automatic measuring systems and devices	55
<i>Chapter 3 Auxiliary tools used in engineering measurements</i>	
I. Principles	60
3.1 Basic concepts of circuit elements, abstractions	60
3.1.1 Ohm's law, complex Ohm's law	60
3.1.2 Circuits, circuit elements	61

3.1.3	Quadrupoles	62
3.1.4	Feedback	63
3.2	Application of logarithmic units	68

Chapter 4 Auxiliary tools used in engineering measurements

II. Auxiliary circuits, basic instruments		71
4.1	Basic measuring circuits	71
4.1.1	Voltage dividers	71
4.1.2	Measuring bridges	72
4.2	Electrical and electronic measuring instruments	74
4.2.1	Electrical instruments	75
4.2.2	Electronic instruments	76

Part II

**CHARACTERISTIC METHODS OF CONVERSION OF NON-ELECTRICAL
QUANTITIES, OPERATIONAL PRINCIPLES AND GENERAL BASIC
RELATIONSHIPS OF TRANSDUCERS USED**

Chapter 5 Introduction to the technique of electrical measurement of non-electrical quantities		83
5.1	The state of the art	83
5.2	General problems of measuring transducers	84
5.3	Classification of transducers; their basic principles	86
5.4	The circuits of transducers measuring non-electrical quantities	90
Chapter 6 Passive transducers and the basic principles of their circuits		
I. Resistive transducers		94
6.1	Potentiometric transducers	95
6.2	Tensometric transducers	99
6.2.1	Basic concepts of stability (elasticity) in tensometric transducers	99
6.2.2	Transducers based on changes in the transitional resistance	104
6.2.3	The principle of strain gauge transduction	105
6.2.4	Strain gauge types.	106
6.2.5	Typical circuits of strain gauge transducers	111
6.3	Thermoresistive transducers. I. Temperature transducers	114
6.3.1	Temperature dependence of the resistance of metallic conductors; the transducers of resistance thermometers	115
6.3.2	Temperature dependent semiconductor resistances (thermistors)	116
6.4	Thermoresistive transducers. II. Thermoanemometry	117
6.4.1	Basic concepts of thermoanemometry; the transducers	118
6.4.2	The static relationships and characteristics of thermoanemometric transducers	120
6.4.3	The dynamic properties of the transducer	123
6.4.4	On the measuring circuits in thermoanemometry	126
6.5	The main measuring circuits of resistive transducers	128

Chapter 7 Passive transducers and the basic principles of their circuits	
II. Capacitive and inductive transducers	132
7.1 Introduction	132
7.2 Capacitive transducers	140
7.2.1 Transducers changing their conductor surfaces. Dielectric transducers	140
7.2.2 Hyperbolic capacitive transducers	142
7.3 Inductive transducers	150
7.3.1 Implementation of inductive transducers	150
7.3.2 The principles of selecting and dimensioning inductive transducers.	155
7.3.3 On the accuracy and matching of inductive transducers	160
7.4 On the circuits of capacitive and inductive transducers	161
Chapter 8 The basic principles of active transducers and their circuits.	168
8.1 Inductance transducers	168
8.2 Thermoelectric transducers (thermoelements)	172
8.3 Piezoelectric transducers and the basic principles of their circuits	177
8.3.1 The piezoelectric effect	177
8.3.2 Piezoelectric transducers	180
8.3.3 Electronic processing of the charge signals of piezoelectric transducers	183
8.3.4 The accuracy of piezoelectric measuring systems, undesirable phenomena and calibration	186
8.3.5 The frequency dependent properties of piezoelectric measuring systems	189
Chapter 9 Other transducers and their associated circuits	195
9.1 Hall generators and their applications in measurements	195
9.2 The basic principles of discrete transducers	199
9.2.1 Basic concepts	199
9.2.2 The implementation of discrete transducers.	204
9.2.3 The layout of discrete transducers	206
9.3 Transducers based on the propagation of various radiations	207
9.3.1 Optical devices in transducers.	207
9.3.2 Ultrasonics in transducers	210
9.3.3 Laser beam and radioactive radiation applications in engineering measurements	213

Part III

THE ELECTRICAL MEASUREMENT OF TYPICAL MECHANICAL ENGINEERING QUANTITIES

Chapter 10 Measurement of linear (length) and angular (angle) displacements and kinematic quantities (path, velocity, acceleration)	219
10.1 Basic concepts of the measurement of lengths and displacements. Units	219
10.2 Measurement of kinematic quantities	221
10.2.1 Measuring linear and angular displacements	222

10.2.2 Measuring velocity, angular velocity and rpm	225
10.2.3 Measuring acceleration and vibration	229
Chapter 11 Measuring force, torque, mechanical work and power	239
11.1 Basic concepts. Units	239
11.2 Measuring force and torque	242
11.2.1 Measuring force and torque by direct conversion	243
11.2.2 Indirect measurement of force and torque	246
11.2.3 Measuring torque by power current methods	261
11.3 Measuring mechanical work and power	264
Chapter 12 Measuring time, frequency and phase angle	266
12.1 Basic problems of time and frequency measurement. Measuring units	266
12.2 Analogue measurement of frequency	267
12.2.1 Analogue frequency measurement based on the frequency dependence of reactive circuit elements	267
12.2.2 Measuring frequency by comparison	271
12.2.3 Measuring frequency by conversion	276
12.3 Digital measurement of frequency and time	277
12.3.1 Time base counters	277
12.3.2 Measurement of frequency	279
12.3.3 Measurement of time (period time)	280
12.3.4 Measurement errors in time base counting	281
12.4 Measurement of phase angles	282
Chapter 13 Measuring pressure, volume and flow rates of liquid and gaseous media	287
13.1 Basic concepts. Measuring units	287
13.1.1 Pressure measurement, scales and units	288
13.1.2 Definitions and units in the measurement of fluid flow	289
13.1.3 Some parameters of the more important liquid and gaseous media in engineering measurements	291
13.2 Measurement of pressure	295
13.2.1 Some electrical instruments widely used in pressure measurements	297
13.2.2 Some practical problems in pressure measurements	308
13.3 Measuring flow velocity and fluid volume	310
13.3.1 Electrical processes and devices for measurement of volumetric flow	310
13.3.2 Turbine type flow meters and their applications	310
13.3.3 Flow meters based on variable pressure drop	317
13.3.4 Measuring flow by constrictive elements with variable cross section and variable load	320
13.3.5 Measuring flow on the basis of the velocity of flow	323
13.3.6 Practical implications of the measurement of fluid flow	327

Chapter 14 Temperature measurement	331
14.1 Basic principles of temperature measurement. Temperature scales	331
14.2 Thermometric methods	332
14.3 Principles of thermometry and thermometers	334
14.4 Electrical temperature measurement	336
14.4.1 Resistance thermometers	336
14.4.2 Measuring temperature with thermocouples	339
References	341
Subject index	349
