

Contents

<i>Introduction</i>	v
1 Fundamentals	1
1.1 Physical Circuit and Model Circuit	1
1.2 Axiomatics of Model Circuits	10
1.3 Basic Elements	16
1.4 Basic Elements and Connections of the SPICE Program	41
1.5 Systems	52
2 Existence and Uniqueness of the Solutions	57
2.1 Motivation through Examples	57
2.2 Existence and Uniqueness Theorem for Differential Equations in Normal Form	81
2.3 System of Circuit Equations and Configuration Space	93
2.4 Global State Equations	105
2.5 Local State Equations	116
3 Resistive Circuits	135
3.1 Tools of Graph Theory	135
3.2 Passivity and Local Passivity	143
3.3 Existence and Uniqueness of the Solution of a Linear Resistive Circuit	152
3.4 Existence and Uniqueness of the Solution of a Nonlinear Resistive Circuit	171
3.5 Properties of the Solutions of a Resistive Circuit	198
4 Circuit Transformations	213
4.1 Duality	213
4.2 Adjoint Circuit, Reciprocity, and Calculation of the Sensitivities	220
4.3 Substitutions	239
5 Asymptotic Behavior and Stability of the Solutions	263
5.1 Statement of the Problem	263
5.2 Concepts of Stability and Liapunov Functions	286
5.3 Steady-State Solutions of Autonomous and Periodic Circuits	310
5.4 Stored Energy	323
5.5 Convergence toward a DC Operating Point	337
5.6 Attractive Domains	346
5.7 Convergence toward a Time-Dependent Steady State	359

6	Analysis of Periodic and Almost Periodic Solutions	377
6.1	Mean Power in a Periodic Steady State and the Page Theorem	377
6.2	Mean Power in an Almost Periodic Steady State and Manley-Rowe Equations	389
7	Optimization of Diode Circuits	401
7.1	Ideal Filter Method	401
7.2	Diode Circuits between Resistive Terminations	404
7.3	Rectifiers	421
7.4	Frequency Multiplication	426
7.5	Diode Circuit Modulation	432
	Bibliography	441
	Select Bibliography	445
	Index	447
