# Contents

|   | Preface  | page ix                                      |
|---|--|--|
| 1 | General introduction – author to reader  | 1  |
|   | PART 1: THE SIMPLE CLASSICAL<br>VIBRATOR   |  |
| 2 | The free vibrator  |  |
|   | Introduction: the special role of harmonic vibrators<br>Anharmonic simple vibrators<br>Using energy conservation to calculate vibration frequency<br>Systems with more than one mode<br>Dissipation<br>Maintained vibrations | 7<br>12<br>21<br>24<br>30<br>39              |
| 3 | Applications of complex variables to linear systems  |  |
|   | Complex exponential solutions to equations of motion<br>The complex <i>p</i> -plane<br>Complex frequency; conventions<br>The vibration diagram<br>Circuit analysis<br>Work and power<br>Waves<br>Circular polarization       | 44<br>46<br>52<br>53<br>55<br>56<br>57<br>62 |
| 4 | Fourier series and integral  |  |
|   | Synthesis of waveforms; Fourier series<br>Beats and related phenomena<br>The Fourier integral<br>Noise<br>White noise<br>Autocorrelation   | 63<br>67<br>69<br>79<br>90<br>93             |
|   |  | V  |

### vi Contents

### 5 Spectrum analysis

| Computation of Fourier transforms          | page 97 |
|--|---------|
| The ear and the eye; optical spectrometers | 100     |
| Linear transducers; response functions     | 105     |
| Causality                                  | 107     |
| Resonant filters: sound spectrograph       | 113     |
| Mixing and combination tones               | 121     |

### 6 The driven harmonic vibrator

| Transfer function, compliance, susceptibility, admittance, |     |
|--|-----|
| impedance  | 128 |
| The form of the resonance curve                            | 134 |
| Low-Q resonant peaks                                       | 140 |
| Transient response   | 142 |
| Response of a resonant system to noise                     | 152 |

#### 7 Waves and resonators

| Preliminary remarks about one-dimensional waves; charac- |     |
|--|-----|
| teristic impedance and admittance                        | 161 |
| Analogues of characteristic impedance                    | 169 |
| Resonant lines   | 171 |
| Finger-holes in woodwind instruments                     | 175 |
| Radiation from an open end                               | 179 |
| Resonators attached to transmission lines                | 184 |
| Excitation of a resonator by a plane wave                | 195 |
| Anomalous dispersion                                     | 204 |

### 8 Velocity-dependent forces

| Coriolis and Lorentz forces          | 209 |
|--------------------------------------|-----|
| Whirling                             | 212 |
| The gyro-pendulum                    | 216 |
| The gyromagnetic top                 | 218 |
| Nuclear magnetic resonance           | 223 |
| The physical mechanism of relaxation | 230 |
| Cyclotron resonance                  | 237 |
| Helicons                             | 239 |

## 9 The driven anharmonic vibrator; subharmonics; stability

| Slightly anharmonic vibrators        | 248 |
|--------------------------------------|-----|
| An example of subharmonic excitation | 253 |

#### Contents

| Behaviour of simple systems near equilibrium                | page 254 | 1 |
|---|----------|---|
| Examples of instability                                     | 259      | ) |
| The slightly anharmonic vibrator revisited                  | 266      | 5 |
| Stability of a system with more than two independent        |          |   |
| variables   | 267      | 7 |
| Stability testing by discrete sampling (stroboscopic method | ) 268    | 3 |
| The subharmonic generator revisited                         | 271      | L |
| The cyclotron, and Azbel'-Kaner cyclotron resonance         | 275      | 5 |
| Conditions for subharmonic generation                       | 278      | 3 |

## 10 Parametric excitation

| Detailed analysis of parametrically excited systems | 289 |
|---|-----|
| Parametric amplifiers                               | 301 |

### 11 Maintained oscillators

| The feedback principle  | 306 |
|---|-----|
| Negative resistance and spontaneous oscillation               | 311 |
| Negative resistance by means of feedback; class C oscillators | 314 |
| The pendulum clock, a non-linear class C oscillator           | 323 |
| Further examples of negative-resistance oscillators           | 326 |
| (a) A resistive feedback network                              | 326 |
| (b) The tunnel diode  | 330 |
| (c) Mechanical analogues of negative and non-linear           |     |
| resistance; Liénard's construction                            | 333 |
| (d) The maser   | 345 |
| Saturation of negative-resistance oscillators                 | 348 |
| Multivibrator   | 353 |
| Relaxation oscillators  | 359 |
| The effect of noise on a class C oscillator                   | 361 |

## 12 Coupled vibrators

| Coupled passive vibrators                             | 366 |
|---|-----|
| Energy and normal modes                               | 372 |
| Examples of coupled vibrators                         | 376 |
| Coupled lossy vibrators                               | 379 |
| Impedances and impulse response functions for coupled |     |
| circuits  | 381 |
| Coupled active and passive vibrators                  | 385 |
| The Huygens phenomenon (entrainment)                  | 391 |
| Frequency-locking of a multivibrator                  | 405 |
| Locking of multivibrator to a resonant circuit        | 413 |
| Superconducting weak links (Josephson junctions)      | 416 |

### viii Contents

| References | <i>page</i> 424 |
|------------|-----------------|
| Index      | 428             |

*Note*: Equations, diagrams and references are numbered serially in each chapter, and the chapter number is omitted if it is something in the same chapter that is referred to. Thus (4.23) in chapter 7 means equation 23 of chapter 4; (23) in chapter 7 means equation 23 in that chapter.

Cross-references are given as page-numbers in the margin.
