Introduction 1

Part A. Fundamental laws of motion for a viscous fluid

CHAPTER I. Outline of fluid motion with friction 4

a. Real and perfect fluids 4
b. Viscosity 5
c. Compressibility 8
d. The Hagen-Poiseuille equations of flow through a pipe 10
e. Principle of similarity; the Reynolds and Mach numbers 11
f. Comparison between the theory of perfect fluids and experiment 18

CHAPTER II. Outline of boundary layer theory 23

a. The boundary layer concept 23
b. Separation and vortex formation 27
c. Turbulent flow in a pipe and in a boundary layer 35

CHAPTER III. Derivation of the equations of motion of a compressible viscous fluid (Navier-Stokes equations) 42

a. Fundamental equations of motion and continuity applied to fluid flow . . . 42
b. General stress system in a deformable body 43
c. General strain system 46
d. Relation between stress system and strain system for solid bodies (Hooke's law) 47
e. Relation between stress and strain system for liquids and gases (Stokes' law of friction) 50
f. The Navier-Stokes equations 51

CHAPTER IV. General properties of the Navier-Stokes equations 55

a. Derivation of Reynolds' principle of similarity from the Navier-Stokes equations 55
b. Frictionless flows as "solutions" of the Navier-Stokes equations 57
c. The Navier-Stokes equations interpreted as vorticity transport equations . . . 58
d. The limiting case of very large viscosity (very small Reynolds number) 60
e. The limiting case of very small viscous forces (very large Reynolds numbers) . . 61
f. Mathematical illustration of the process of going to the limit $R \to \infty$ 63

CHAPTER V. Exact solutions of the Navier-Stokes equations 66

a. Parallel flow 66
1. Two-dimensional flow through a straight channel and Couette Flow . . 66
2. The Hagen-Poiseuille theory of flow through a pipe 68
3. The flow between two concentric rotating cylinders 70
4. The suddenly accelerated plane wall; Stokes' first problem 72
5. Flow formation in Couette motion 73
6. Flow in a pipe, starting from rest 74
7. The flow near an oscillating flat plate; Stokes' second problem 75
b. Other exact solutions 78
8. Stagnation in plane flow (Hiemenz Flow) 78
9. Stagnation in three-dimensional flow 81
10. Flow near a rotating disk 83
11. Flow in convergent and divergent channels 89

page

CHAPTER VI. Very slow motion 94

a. The differential equations for the case of very slow motion 94
b. Parallel flow past a sphere 95
c. The hydrodynamic theory of lubrication 98
d. The Hele-Shaw flow 104

Part B. Laminar boundary layers

CHAPTER VII. Boundary layer equations for two-dimensional flow; boundary layer on a plate 107

a. Derivation of boundary layer equations for flow along a flat plate 107
b. Boundary layer equations for curved walls 111
c. Some physical properties of boundary layers 112
d. A remark on the integration of the boundary layer equations 114
e. Skin friction 115
f. The boundary layer along a plate 116
g. The role of free-stream turbulence 126

CHAPTER VIII. General properties of the boundary layer equations 128

a. Dependence of the characteristics of a boundary layer on the Reynolds number 128
b. 'Similar' solutions of the boundary layer equations 130
c. Continuation problem; conditions of compatibility at the wall 135
d. Transformation of the boundary layer equations into the heat conduction equation 136
e. The momentum and energy integral equations for the boundary layer 137

CHAPTER IX. Exact solutions of the steady-state boundary layer equations in two-dimensional motion 142

a. Flow past a wedge 143
b. Flow in a convergent channel 144
c. Flow past a cylinder; symmetrical case (the Blasius series) 146
d. Boundary layer for the potential flow given by $U(x) = U_0 - a\,x^n$ 156
e. A new series due to H. Goertler 158
f. Flow in the wake of flat plate at zero incidence 160
g. The two-dimensional jet 164
h. Flow in the inlet length of a straight channel and a circular pipe 168
i. Continuation problem; step-by-step method 171

CHAPTER X. Axially symmetrical and three-dimensional boundary layers 176

a. Axially symmetrical boundary layers on bodies at rest 176
1. Rotation near the ground 176
2. The circular jet 181
3. Boundary layer on a body of revolution 185
4. Relation between axially symmetrical and two-dimensional boundary layers 190
b. Three-dimensional boundary layers: the boundary layer on a yawed cylinder 191
c. Boundary layers on rotating bodies 201

CHAPTER XI. Non-steady boundary layers 207

a. General remarks on the calculation of non-steady boundary layers 207
b. Boundary layer formation after impulsive start of motion 212
1. Two-dimensional case 212
2. Axially symmetrical problem 216
c. Boundary layer formation with constant acceleration 219
d. Experimental investigation of the starting process 221
e. Periodic boundary layer flows 224
1. Oscillating cylinder in fluid at rest 224
2. Oscillating flow through a pipe 229
3. C. C. Lin's theory of harmonic oscillations 232
4. Progressing wave 234

page

CHAPTER XII. Approximate methods for the solution of the boundary layer equations 238

a. Application of the momentum equation to the flow past a flat plate at zero incidence . . . 238
b. The approximate method due to Th. von Kármán and K. Pohlhausen for two-dimensional flows . . . 243
c. Comparison between the approximate and exact solutions . . . 251
1. Flat plate at zero incidence . . . 251
2. Two-dimensional stagnation flow . . . 251
3. Flow past a circular cylinder . . . 252
d. Further examples . . . 254
e. Application of the approximate method to bodies of revolution and three-dimensional boundary layers . . . 256
f. Other approximate methods . . . 259
g. Laminar flow against pressure gradient; separation . . . 260

CHAPTER XIII. Boundary layer control . . . 266

a. Methods of boundary layer control . . . 266
1. Motion of the solid wall . . . 267
2. Acceleration of the boundary layer . . . 268
3. Suction . . . 269
4. Prevention of transition by the provision of suitable shapes. Laminar aerofoils 269
b. Boundary layer suction . . . 270
1. Theoretical results . . . 270
1.1. Fundamental equations . . . 270
1.2. Exact solutions . . . 271
1.3. Approximate solutions . . . 277
2. Experimental results on suction . . . 279
2.1. Increase in lift . . . 279
2.2. Decrease in drag . . . 282

CHAPTER XIV. Thermal boundary layers in laminar flow . . . 288

a. Derivation of the energy equation . . . 288
b. Temperature increase through adiabatic compression; stagnation temperature 292
c. Theory of similarity in heat transfer . . . 294
d. Boundary layer simplifications . . . 299
e. General properties of thermal boundary layers . . . 302
1. Forced and natural flows . . . 302
2. Adiabatic wall . . . 303
3. Analogy between heat transfer and skin friction . . . 303
f. Exact solutions for the problem of temperature distribution in a viscous flow 306
1. Couette flow . . . 306
2. Poiseuille flow through a channel with flat walls . . . 310
g. Thermal boundary layers in forced flow . . . 311
1. Parallel flow past a flat plate at zero incidence . . . 311
2. Thermal boundary layers for other body shapes; theoretical results . . . 319
3. Other body shapes; measurements . . . 324
4. Effect of free-stream turbulence . . . 326
h. Thermal boundary layers in natural flow . . . 332

CHAPTER XV. Boundary layers in compressible flow . . . 339

a. Introductory remarks . . . 339
b. Relation between the velocity and the temperature fields . . . 341
c. The flat plate at zero incidence . . . 344
d. Boundary layer with non-zero pressure gradient . . . 350
1. Exact solutions . . . 350
2. Approximate methods . . . 355
e. Interaction between shock wave and boundary layer . . . 364

page

Part C. Transition

CHAPTER XVI. The origin of turbulence I 375

a. Some experimental results on transition from laminar to turbulent flow . . . 375
1. Transition in pipe flow 375
2. Transition in the boundary layer on a solid body 378
b. Principles of the theory of stability of laminar flows 382
1. Introductory remarks 382
2. Foundation of the method of small disturbances 383
3. Mathematical form of the disturbance 385
4. The eigen-value problem 386
5. General properties of the disturbance differential equation 388
c. Results of the theory of stability as they apply to the boundary layer on a flat plate at zero incidence 391
1. Some older investigations into stability 391
2. Tollmien's method for the calculation of the curve of neutral stability . . 392
3. Results for the flat plate 396
d. Comparison of the theory of stability with experiment 399
1. Older measurements of transition 399
2. Verification of the theory of stability by experiment 401

CHAPTER XVII. Origin of turbulence II 409

a. Effect of pressure gradients on transition in boundary layer along flat walls . . 409
b. Determination of the position of the point of instability for prescribed body shape 414
c. Effect of suction on transition in a boundary layer 423
d. Effect of body forces on transition 428
1. Boundary layers on convex walls (centrifugal forces) 428
2. The flow of non-homogeneous fluids (stratification) 431
e. Effects due to heat transfer and compressibility 433
1. Introductory remark 433
2. The effect of the transfer of heat 433
3. The effect of compressibility 435
f. Stability of a boundary layer in the presence of three-dimensional disturbances 439
1. Flow between concentric rotating cylinders 439
2. Boundary layers on concave walls 440
3. Stability of three-dimensional boundary layers 445
g. The influence of roughness on transition 445
1. Introductory remark 445
2. Single cylindrical roughness elements 446
3. Distributed roughness 449
h. Axially-symmetrical flows 450

Part D. Turbulent boundary layers

CHAPTER XVIII. Fundamentals of turbulent flow 457

a. Mean motion and fluctuations 458
b. Additional, "apparent" turbulent stresses 460
c. Derivation of the stress tensor of apparent turbulent friction from the Navier-Stokes equations 462
d. Account of some measurements on fluctuating turbulent velocities 465
e. Wind tunnel turbulence 470

CHAPTER XIX. Theoretical assumptions for the calculation of turbulent flows . . . 475

a. Fundamental equations 475
b. Prandtl's mixing length theory 477
c. Two further assumptions for the turbulent shearing stress 480
d. G. I. Taylor's vorticity transfer theory 482
e. Von Kármán's similarity hypothesis 485

page

f. Universal velocity distribution law 487
1. Von Kármán's velocity distribution law 487
2. Velocity distribution from Prandtl's theory 488
g. Heat transfer in turbulent flow 492
h. Further development of theoretical hypotheses 500

CHAPTER XX. Turbulent flow through pipes 502

a. Experimental results for smooth pipes 502
b. Relation between law of friction and velocity distribution 506
c. Universal velocity distribution laws for very large Reynolds numbers . . . 508
d. Universal resistance law for smooth pipes at very large Reynolds numbers . 514
e. Pipes of non-circular cross-section 517
f. Rough pipes and equivalent sand roughness 519
g. Other types of roughness 527
h. Flow in curved pipes 529
i. Non-steady flow through a pipe 531

CHAPTER XXI. Skin friction drag of a flat plate at zero incidence; Rotating disks; Roughness 534

a. The smooth flat plate 535
1. Resistance formula deduced from the $^1/_7$-th-power velocity distribution law 536
2. Resistance formula deduced from the logarithmic velocity distribution law 539
3. Further refinements 541
4. Influence of Mach number 543
b. The rotating disk 547
1. The "free" disk 547
2. The disk in a housing 548
c. The rough plate 551
1. The resistance formula for a uniformly rough plate 551
2. Measurements on single roughness elements 553
3. Transition from a smooth to a rough surface 557
d. Admissible roughness 557

CHAPTER XXII. The turbulent boundary layer with positive and negative pressure gradient 566

a. Some experimental results 566
b. The calculation of two-dimensional turbulent boundary layers 567
1. General remarks 567
2. The characteristic parameters of a boundary layer 569
3. Calculation of the momentum thickness 571
4. Calculation of the shape factor 576
5. Procedure and numerical example 579
6. Turbulent boundary layers with suction 583
7. Boundary layers on cambered walls 584
c. Three-dimensional boundary layers 584
1. Boundary layers on bodies of revolution 584
2. Boundary layers on rotating bodies 585
3. Convergent and divergent boundary layers 585

CHAPTER XXIII. Free turbulent flows; jets and wakes 590

a. General remarks 590
b. Estimation of the increase in width and of the decrease in velocity 592
c. Examples 596
1. The smoothing out of a velocity discontinuity 596
2. Free jet boundary 598
3. Two-dimensional wake behind a single body 600

page

4. The wake behind a row of bars 604
5. The two-dimensional jet 605
6. The circular jet 607
d. Inductive theory of turbulence due to H. Reichardt 609
e. Heat transfer in free turbulent flow 611

CHAPTER XXIV. Determination of profile drag 615

a. General remarks 615
b. The experimental method due to Betz 616
c. The experimental method due to Jones 618
d. Calculation of profile drag 620
e. Losses in the flow through cascades 625
