Abridged contents of volumes I, II, III and IV	xix

Chapter 5

Basic thermodynamic concepts and equations

5.1 Kinetic energy theorem and work of internal surface forces	1
Kinetic energy of the volume V of a continuous medium 1. Work of internal and external mass forces 2. Work done by external surface forces 3. Definition of work done by internal surface forces 3. The kinetic energy theorem for a finite volume of a continuum 3. The work of internal surface forces when the stress tensor is symmetric 4. Kinetic energy theorem for an infinitesimal volume of a continuum 4. Work density of internal forces in the case of ideal fluids 6.	
5.2 The first law of thermodynamics (principal of conservation of energy) and the equation of heat flow	7
Variables of state 7. On the number of variables of state for continuous media 8. Complete systems of determining parameters 10. On holonomic and non-holonomic thermodynamical systems 11. Space of states 12. Processes and cycles 13. On the interaction of systems with external objects 14. The principle of conservation of energy. The first law of thermodynamics 18. Total energy of a system 19. Internal energy of a system 21. Equation of the law of conservation of energy 23. Equation of heat flow 23. The differential equation of heat flow 24.	
5.3 Thermodynamic equilibrium; reversible and irreversible processes	25
Thermodynamic equilibrium 25. Equilibrium and non-equilibrium process 26. Reversible and irreversible processes 26. Example of a process which	

Contents

	may be practically considered to be reversible 27. On equilibrium and most probable states 28. Macroscopic characteristics, mean probabilities and irreversibility 28. On the concept of temperature 28.	
5.4	Two-parameter media. Perfect gas. Carnot cycle	30
	Equation of heat flow for an ideal gas 31. Equation of state of a perfect gas 31. Internal energy of a perfect gas 32. Specific heats at constant volume and pressure. Mayer's formula 32. Physical mechanisms of supply of heat to a medium 33. Adiabatic processes 34. Isothermal processes 34. Polytropic processes 35. Isotherms of a perfect gas 36. Poisson's adiabat 37. Mutual disposition of isotherms and adiabats for a perfect gas 38. Work performed by a system 39. The total heat flow which is supplied to a system from outside 39. Carnot cycle 40. Example of an engine which does work over a reversible Carnot cycle 40. The system executing a Carnot cycle, as a heat engine or a refrigerator 41.	
5.5	The second law of thermodynamics and the concepts of entropy	43
	Efficiency of Carnot cycle 43. Carnot's theorem 44. Quantitative formulation of the second law of thermodynamics in conformity with a reversible Carnot cycle 48. Quantitative formulation of the second law of thermodynamics in conformity with an arbitrary reversible cycle 48. Introduction of entropy with the help of reversible processes for two-parameter media 51. The entropy for a perfect gas 52. Conditions imposed by the existence of entropy on the form of the equation of state 52. Quantitative formulation of the second law of thermodynamics applicable to an irreversible Carnot cycle 53. Example illustrating the character of variations of the entropy in irreversible processes 53. Quantitative formulation of the second law of thermodynamics applicable to a multi-parameter medium 54. Equivalence of the formulations of the second law of thermodynamics 56. Quantitative formulation of the second law of thermodynamics with respect to irreversible processes in any medium 57. Quantitative formulation of the second law of thermodynamics with respect to reversible processes in any medium 57. Introduction of entropy for multiparameter media with the aid of reversible processes 57. Uncompensated heat 58. On the work done by a heat engine for $dQ^{**} \neq 0$. 59. On processes which are closed with respect to the energy parameters and open with respect to the parameters of entropy 60. On the introduction of entropy by statistical means 61. Additivity of entropies 61. On the growth of entropy as a system tends to equilibrium 62. Adiabatic reversible and irreversible processes 62. Principle of non-decrease of entropy for insulated systems and condition of equilibrium 62.	
5.6	Thermodynamic potentials of two-parameter media	63
	Internal energy and entropy as thermodynamic potentials 63. Free energy 64. Heat content or enthalpy 64. Gibb's thermodynamic potential 65.	

A medium is defined by thermodynamic potentials as functions of corresponding variables 66. On the determination of thermodynamic potentials 66.	
5.7 Examples of ideal and viscous fluids and their thermodynamic properties. Heat conduction	69
Work of internal forces in the case of an ideal incompressible fluid 70. Entropy and internal energy of an ideal incompressible fluid 70. Independence of mechanical problem from the heat problem and the link between the heat problem and the mechanical problem in the motion of an ideal incompressible fluid 71. Model of an ideal gas 72. Complete system of equations of motion of an ideal gas in the case of adiabatic processes 73. Complete system of equations of motion of an ideal gas for isothermal processes 73. Perfect gas 74. Definition of a model of a viscous fluid 74. Work done by the internal forces in a viscous fluid 75. Pressure and temperature in a viscous fluid 75. Expression for uncompensated heat in a viscous fluid 76. Dissipation of mechanical energy in a viscous fluid 76. Positiveness of the coefficients of viscosity 77. Heat flow vector 78. Fourier's law of heat conduction 79. Expression for heat flow due to heat conduction obeying Fourier's law 79. Equation of heat flow for a viscous heat conducting fluid 80. Complete system of equations of motion of a viscous fluid 80.	
5.8 First and second laws of thermodynamics for finite volumes of continuous media. Generation of entropy in certain irreversible processes	81
First and second laws of thermodynamics for finite volumes of continua 81. Heat conduction as an irreversible process 82. Criteria for irreversibility 83. Formulae for the generation of entropy 84. Dissipation function 84. On the theory of Onsager 85.	
Chapter 6	
Basic concepts and equations of electrodynamics	
6.1 Basic concepts of electrodynamics. Electromagnetic field. Maxwell's equations in vacuum	86
Coulomb's law for charges at rest 87. Charge density 88. Electric current 88. Polarization of atoms 88. Magnetic interaction 89. Electric and magnetic stress vectors 89. Maxwell equations in electrostatics 91. The differential equations of the potential field in Newtonian mechanics 91. Maxwell's equations for an electromagnetic field in vacuum 93. On dimensional units of electromagnetic quantities 94. The closed nature and lack of contradiction of the system of Maxwell's equations in vacuum 95.	

Contents

	On the applicability of Maxwell's equations (6.1.11) and (6.1.12) inside material bodies 96.	On the significance of Maxwell's equations 97.
6.2	Maxwell's equations in Minkowski space	97
	Formulation of Maxwell's equations in four-dimensional space 97. Interpretation of the quantity c as the velocity of light 98. Minkowski space 99. Transformation of Maxwell's equations to arbitrary curvilinear coordinates 100. Transformation restricted to space coordinates 102. Lorentz transformation 102. Invariance of Maxwell's vector equations with respect to the Lorentz transformation 103. Galilei transformations 103. Tensor and vector characteristics in Minkowski space: energy-impulse tensor 104.	
6.3	Lorentz transformations and inertial reference frames	104
	The principle of relativity in physics 104. Inertial systems in Newtonian mechanics 105. Postulate on the constancy of the speed of light 105. On inertial coordinate systems in the special theory of relativity 106. Transformation of coordinates for transition from one inertial system to another 107. Properties of Lorentz transformations 108. The transformations of Galilei and Lorentz contain the same number of independent parameters, namely ten 110. Infinitesimal Lorentz transformations 111. Lorentz transformations for translation of the system K' with respect to the system K 112. The relativity of the concept of time 112. Different time intervals 113. Characteristic reference system 113. Characteristic time 114. Characteristic and concomitant coordinate systems 114. Time paradox 114. Transformations of $\mathbf{E}$ and $\mathbf{H}$ for transition from K to K' 115. On invariant characteristics of an electromagnetic field 116. On the vectors $\mathbf{E}$ and $\mathbf{H}$ in the reference systems normally used in practical applications 117. Approximate transformation formulae for $\mathbf{E}$ and $\mathbf{H}$ (including terms of the order v/c) 117.	
6.4	Interaction of electromagnetic field with conductors	118
	Three-dimensional and four-dimensional current density vectors. Conductance current 118. Maxwell equations in conductors 119. Displacement current 119. Law of conservation of total charge 120. The system of Maxwell's equations in conductors is an incomplete system 120. On a link between problems of electrodynamics and continuum mechanics 121. Ohm's law for immobile conductors 121. Conductivity 121. Ohm's law in the characteristic coordinate system 121. Media with infinite conductivity 122. Lorentz force 123. Impulse equations with inclusion of ponderomotive forces 124. Energy interactions between a field and conducting media 124. Umov-Poynting vector 125. Equation of Umov-Poynting 125. Energy of an electromagnetic field 125. Joule heat 126. Inflow of heat energy from a field into a medium at rest 126. Change of energy of an electromagnetic field in vacuum 126. Equation of heat flow for conducting media 127.	

6.5	Interaction of an electromagnetic field with bodies in the presence of polarization and magnetization	128
	Maxwell's equations in the presence of polarization and magnetization. Vectors of electric and magnetic induction, magnetization and polarization 128. Maxwell's equations in integral form 129. Maxwell's tensor equations in the presence of electric currents, polarization and magnetization 129. Invariance with respect to Lorentz transformations 130. Transformations of the basic vectors of the electromagnetic field during transition from one inertial reference system to another 130. Vector potential 131. Minkowski tensor 131. Four-dimensional vector of the ponderomotive force 132. On additional relations of electrodynamics which close Maxwell's equations (6.5.1) and (6.5.2) 134. Laws of magnetization and polarization in tensorial form 134. Ponderomotive forces 135. Flux of energy from a field to a body 136. Moment equation in four-dimensional form 139. The tensor of the ponderomotive moment of an electromagnetic field 141. Three-dimensional space vectors for the ponderomotive moment 142. On different definitions of the energy-impulse tensor and the moment tensor of an electromagnetic field 143. Motives for the introduction of a symmetric energy-impulse tensor 145.	
6.6	Magnetohydrodynamics	146
	Equations of magnetohydrodynamics for media with infinite conductivity 147.	
6.7	The laws of freezing in of magnetic and vortex flux lines . . .	149
	Derivation of the formula for the time derivative of the flow of a solenoidal vector through a fluid surface 150. Thomson's theorem 154. The possibility of an appearance of closed contours with $\Gamma \neq 0$ in a potential flow with surfaces of velocity discontinuity 155. Lagrange's theorem 156. Helmholtz' dynamic vortex theorems 157.	

Chapter 7

On the formulation of problems in continuum mechanics

7.1	General foundations of the formulation of concrete problems	158
	Models and reference systems 158. The necessity for supplementary conditions, separating different motions 160. The region occupied by a continuous body and the time interval of a motion 161. Conditions at infinity 161. Singular points inside a medium 162. Initial conditions 162. Boundary conditions 163. Conditions of adhesion at boundaries for displacements and velocities 164. Condition of stream line flow around a body for an ideal fluid 165. Conditions at a free surface 166. Conditions at free surfaces in an ideal fluid 167.	

Contents

7.2	Typical simplifications in the formulations of certain problems, leading to a reduction of the number of independent variables	168
	Steady motions 168. Two-dimensional motions 168. Two-dimensional potential motions of an incompressible fluid 169. Axisymmetric motions 170. One-dimensional unsteady motions 171. Motion with plane waves 171. Motion with cylindrical waves 171. Motion with spherical symmetry 171. Self-similar motions 172.	
7.3	Linearization of equations and of problems of continuum mechanics	173
	The non-linearity of problems of continuum mechanics 173. Small perturbations of states of equilibrium or of basic motions 173. Linearization of problems of continuum mechanics 174. Linearization of the equations 174. Linearization of boundary conditions 175. Superposition of solutions 176. Standing waves 177. Progressive waves 178. On linearization with the aid of special variables 178.	
7.4	Conditions on surface of strong discontinuity	179
	On surfaces of discontinuity in continuum mechanics 179. On discontinuous motion as the limit of continuous motions for different complicated models 180. Structure of discontinuities 181. Discontinuous solutions as limits of continuous solutions within the framework of an established model 182. Discontinuous solutions as limits of continuous solutions with suitable external effects 182. On the expediency of the study of discontinuous solutions 183. The role of integral laws in the determination of models 183. On the solution of problems in the class of piecewise smooth functions 184. Weak and strong discontinuities 185. Velocity of the points of a surface of discontinuities 185. Velocity of the points of a surface of discontinuity 185. Choice of coordinate systems 187. Subdivision of the volume V adjoining a surface of discontinuity 187. Limit of the derivative of the integral with respect to a fluid volume as it is shrunk to a point of the surface of discontinuity 188. The universal equations of mechanics and thermodynamics 189. Surface density of external effects on a surface of discontinuity 191. Conditions on surfaces of discontinuity in the "characteristic" reference system 192. On the disintegration of an arbitrary discontinuity 193. Conditions on surfaces of discontinuity in an arbitrary reference system 193. Velocity of surface of discontinuity relative to a medium 194. Tangential discontinuities 194. Condensation and rarefaction jumps 195.	
7.5	Strong discontinuities in an electromagnetic field	196
	Conditions on surface of discontinuity 197. Surface densities of ponderomotive forces and energy fluxes from a field to a medium on a surface of discontinuity 199.	

7.6	Surfaces of discontinuity inside ideal compressible media . .	202
	Conditions on a fixed jump 202. Propagation of a discontinuity over the particles of a medium 203. Condensation and rarefaction jumps 204. On a jump of internal energy 204. Hugoniot's adiabat 205. Entropy change along Hugoniot's adiabat 206. Entropy change along Hugoniot's adiabat for a small pressure jump 207. Poisson's adiabat 207. Poisson's and Hugoniot's adiabats at the point p_1, V_1 have a second order contact 207. Weak jumps are spread by the particles at the velocity of sound 208. Relative locations of Hugoniot's and Poisson's adiabats near the point p_1, V_1 209. Equations of Poisson's and Hugoniot's adiabats for a perfect gas 210. For the perfect gas, the entropy increases monotonically together with the pressure along Hugoniot's adiabat 210. Condensation jumps are real, rarefaction jumps cannot exist 211. When rarefaction jumps are feasible 211. The velocity of propagation by particles of a condensation jump through a discontinuity is supersonic 212. Fixed jumps may exist only in supersonic flow 213. Different Hugoniot adiabats corresponding to the points p_1, V_1 and p_2, V_2 213. The velocity of particles of a medium, passing through a condensation jumps, is subsonic relative to the jump 214. Problem of a piston with plane waves 214. Spherical piston 216. The problem of the point explosion 217. On detonation and combustion waves 219. The problem of a piston with a detonation wave 219. Relations at fixed shock waves for a perfect gas 220. The shock wave is a hypercissoid 221. Straight and oblique condensation jumps 222. On the rotation of the velocity in oblique condensation jumps 222. Supersonic flow around an angle and a wedge 223. Flow with a detached wave 224. Loss of mechanical energy in jumps 224.	
7.7	Dimensionality of physical quantities and Π -theorem . . .	226
	Physical relations are invariant with respect to the choice of coordinate systems 226. Tensorial nature of physical equations 226. Dimensional quantities 226. Primary (fundamental) dimensional units 227. Secondary (derived) dimensional units 227. Various systems of dimensional units 227. Formula of dimensionality 228. Number of primary dimensional units 229. On the possibility of increasing the number of primary dimensional units 229. On the possibility of reducing the number of primary dimensional units 230. Relativity of the concepts of dimensional and non-dimensional quantities 230. Appearance of dimensional physical constants as arguments of functions under study 231. On the possible benefit of an application of different systems of dimensional units 232. Π -theorem 233.	
7.8	Parameters determining a class of phenomena and typical examples of the application of the methods of dimensional analysis	238
	Elucidation of the system of determining parameters on the basis of the	

Contents

mathematical formulation of a problem 238. For the isolation of the table of determining parameters, a mathematical formulation of a problem is not required 239. Finite system of determining parameters 239. The system of determining parameters must be complete 239. Insufficiency of dimensional theory for the solution of problems 240. The problem of the spherical piston in a gas 241. The problem of the point explosion 244. Formulation of the problem of a strong explosion 245. Motion of a rigid body in an infinite mass of viscous incompressible fluid 249. Absolute motion 250. Conversion of a motion. The problem of stream line flow 250. System of the parameters which determine the velocity and stress fields in the case of the motion of a body in a viscous fluid 251. Lift force and resistance 252. A change of the pressure p_∞ does not affect the total force 252. Motions in a viscous fluid for low Reynolds' numbers 256. Motion in a viscous fluid for very large Reynolds' numbers 257. Ship resistance 258. Problem of the motion of a body in an ideal gas 259. Problem of Boussinesq 260.

7.9	Similarity and modelling of phenomena	262
	Modelling and physical similarity 262. Similarity criteria 264. Similarity for the flow of a viscous incompressible fluid around bodies 265. Similarity in the flow around bodies taking into account compressibility of the gas 266. On the difficulties of modelling 266. Modelling of ship motions 267. Modelling keeping Froude's number constant 268. Modelling using a centrifugal table 269. Small scale structures are stronger 270.
