Preface	VII
Acknowledgements	XVII
Part 1. Review of basic concepts and equations of fluid dynamics	1
I. Introduction to Fluid Dynamics	1
(1) Fluid Model of Systems	1
(2) The Objective of Fluid Dynamics	1
(3) The Fluid State	2
(4) Description of the Flow Field	3
(5) Volume Forces and Surface Forces	3
(6) Relative Motion Near a Point	5
(7) Stress–Strain Relations	8
(8) Equations of Fluid Flows	9
(i) The Law of Conservation of Mass	9
(ii) Equation of Motion	10
(iii) The Energy Equation	10
(iv) The Equation of Vorticity	13
(v) The Incompressible Fluid	13
(9) Surface Tension	14
(i) Capillary Rises in Liquids	16
(10) A Program for Analysis of the Governing Equations	17
Part 2. Dynamics of incompressible fluid flows	19
I. Fluid Kinematics and Dynamics	19
(1) Stream Function	19
(2) Equations of Motion	20
(3) Integrals of Motion	21
	IX

(4) Capillary Waves on a Spherical Drop	22
(5) Cavitation	23
(6) Irrotational Flow	24
(7) Simple Flow Patterns	25
(i) The Source Flow	25
(ii) The Doublet Flow	26
(iii) The Vortex Flow	27
(a) Doublet in a Uniform Stream	28
(b) Uniform Flow past a Circular Cylinder with Circulation	28
II. The Complex-Variable Method	30
(1) The Complex Potential	30
(2) Conformal Mapping of Flows	32
(3) Hydrodynamic Images	37
(4) Principles of Free-Streamline Flow	39
(i) Schwartz–Christoffel Transformation	39
(ii) Hodograph Method	45
III. Three Dimensional Irrotational Flows	49
(1) Special Singular Solutions	49
(i) The Source Flow	50
(ii) The Doublet Flow	51
(2) Image of a Source in a Sphere	52
(3) Flow past an Arbitrary Body	54
(4) Unsteady Flows	55
(5) Added Mass of Bodies Moving Through a Fluid	56
IV. Vortex Flows	57
(1) Vortex Tubes	57
(2) Induced Velocity Field	58
(3) Biot–Savart’s Law	59
(4) Vortex Ring	64
(5) Hill’s Spherical Vortex	66
(6) Vortex Sheet	68
(7) The Vortex Breakdown: Brooke Benjamin’s Theory	70
V. Rotating Flows	75
(1) Governing Equation and Elementary Results	75
(2) Taylor–Proudman Theorem	76
(3) Propagation of Waves in a Rotating Fluid	76
(4) Plane Inertial Waves	77
(5) Forced Wavemotion in a Rotating Fluid	79
(i) The Elliptic Case	80
(ii) The Hyperbolic Case	81
(6) Slow Motion Along the Axis of Rotation	82
(7) Rossby Waves	85

VI. Water Waves	88
(1) Governing Equations	89
(2) Surface Waves in a Semi-Infinite Liquid	90
(3) Surface Waves in a Liquid Layer of Finite Depth	90
(4) Shallow-Water Waves	92
(5) Water Waves Generated by an Initial Displacement over a Localised Region	94
(6) Water Waves Generated by a Finite Train of Harmonic Waves	97
(7) Waves on a Steady Stream	98
(i) One-dimensional Gravity Waves	99
(ii) One-dimensional Capillary-gravity Waves	100
(iii) Ship Waves	101
(8) Gravity Waves in a Rotating Fluid	102
(9) Theory of Tides	103
(10) Nonlinear Shallow Water Waves	107
(i) Solitary Waves	109
(ii) Stokes Waves	111
(iii) Modulational Instability and Envelope Solutions	112
(11) Nonlinear Resonant Three-wave Interactions of Capillary-gravity Waves	115
(12) Second-harmonic Resonance	119
(13) Hydraulic Jump	122
VII. Applications to Aerodynamics	123
(1) Airfoil Theory: Method of Complex Variables	123
(i) Force and Moments on an Arbitrary Body	124
(ii) Flow Past an Arbitrary Cylinder	125
(iii) Flow Around a Flat Plate	128
(iv) Flow Past an Airfoil	129
(v) Joukowski Transformation	132
(2) Thin Airfoil Theory	135
(i) Thickness Problem	137
(ii) Camber Problem	140
(iii) Flat Plate at an Angle of Attack	143
(iv) Combined Aerodynamic Characteristics	145
(v) The Leading-Edge Problem of a Thin Airfoil	145
(3) Slender-Body Theory	149
(4) Lifting-Line Theory for Wings	149
(5) Oscillating Thin-Airfoil Theory	154
Part 3. Dynamics of compressible fluid flows	165
I. Review of Thermodynamics	165
(1) Thermodynamic System and Variables of State	165
(2) The First Law of Thermodynamics, and Reversible and Irreversible Processes	166
	XI

(3) The Second Law of Thermodynamics	168
(4) Liquid and Gaseous Phases	169
(5) Application of Thermodynamics to Fluid Flows	170
II. Isentropic Flows	171
(1) The Energy Equation	171
(2) Stream-Tube Area and Velocity Relations	172
III. Shock Waves	174
(1) The Normal Shock Wave	175
(2) The Oblique Shock Wave	180
(3) Blast Waves: Sedov's Solution	183
IV. Flows with Heat Transfer	186
(1) Rayleigh Flow	186
(2) Detonation and Deflagration Waves	187
V. Potential Flows	190
(1) Governing Equations	190
(2) Streamline Coordinates	192
(3) Conical Flows	193
(4) Small Perturbation Theory	195
(5) Characteristics	197
VI. The Hodograph Method	209
(1) The Hodograph Transformation	209
(2) The Lost Solution	213
(3) The Limit Line	214
VII. Nonlinear Theory of Plane Waves	219
(1) Riemann Invariants	219
(2) Burgers' Equation	224
VIII. Applications to Aerodynamics	228
(1) Thin Airfoil Theory	228
(i) Thin Airfoil in a Linearised Supersonic Flow	228
(ii) Far-Field Behaviour of Supersonic Flow Past a Thin Airfoil	230
(iii) Thin Airfoil in Transonic Flows	233
(2) Slender Bodies of Revolution	235
(3) Oscillating Thin Airfoil in Subsonic Flows: Possio's Theory	239
(4) Oscillating Thin Airfoils in Supersonic Flows: Stewartson's Theory	245
Part 4. Dynamics of Viscous Fluid Flows	249
I. Exact Solutions to Equations of Viscous Fluid Flow	249
XII	

(1) Channel Flows	249
(2) Decay of a Line Vortex	250
(3) Line Vortex in a Uniform Stream	252
(4) Diffusion of a Localised Vorticity Distribution	253
(5) Flow due to a Suddenly Accelerated Plane	257
(6) The Round Laminar Jet: Landau's Solution	259
(7) Ekman Layer at a Free Surface in a Rotating Fluid	261
(8) Centrifugal Flow due to a Rotating Disk	262
(9) Shock Structure: Becker's Solution	264
(10) Couette Flow of a Gas	266
II. Flows at Low Reynolds Numbers	268
(1) Dimensional Analysis	268
(2) Stokes' Flow Past a Rigid Sphere	269
(3) Stokes' Flow Past a Spherical Drop	271
(4) Stokes' Flow Past a Rigid Circular Cylinder	274
(5) Oseen's Flow Past a Rigid Sphere	275
(6) Oseen's Approximation for Periodically Oscillating Wakes	277
III. Flows at High Reynolds Numbers	280
(1) Prandtl's Boundary-Layer Concept	281
(2) The Method of Matched Asymptotic Expansions	281
(3) Location and Nature of Boundary Layers	285
(4) Incompressible Flow Past a Flat Plate	288
(i) The Outer Expansion	288
(ii) The Inner Expansion	289
(iii) Flow due to Displacement Thickness	291
(5) Separation of Flow in a Boundary Layer: Landau's Theory	292
(6) Boundary Layers in Compressible Flows	294
(i) Crocco's Integral	296
(ii) Flow Past a Flat Plate: Howarth–Dorodnitsyn Transformation	297
(7) Flow in a Mixing Layer Between Two Parallel Streams	299
(i) Geometrical Characteristics of the Mixing Flow	301
(8) Narrow Jets	302
(9) Wakes	303
(10) Periodic Boundary Layer Flows	304
(11) Effect of Rotation on Flow Past a Flat Plate due to Standing Sound Field	306
IV. Jeffrey–Hamel Flow	309
(1) The Exact Solution	310
(2) Flows at Low Reynolds Numbers	313
(3) Flows at High Reynolds Numbers	317

Part 5. Hydrodynamic stability

I. Introduction to Hydrodynamic Stability	319
II. Thermal Instability of a Layer of Fluid Heated from Below	320
(1) The Characteristic-Value Problem	320
(2) The Variational Problem	324
III. Stability of Couette Flow	327
(1) Inviscid Couette Flow: Rayleigh Criterion	327
(i) Heuristic Derivation	327
(ii) Rigorous Derivation	328
(2) Viscous Couette Flow: Synge's Theory	330
IV. Rayleigh–Taylor Instability of Superposed Fluids	337
(1) The Linear Problem	337
(2) The Nonlinear Problem	339
V. Kelvin–Helmholtz Instability	342
(1) The Stratified Fluid in Nonuniform Streaming	342
(2) The Case of Two Uniform Fluids in Relative Motion Parallel to the Plane Interface	344
(3) A Shear Layer in a Stratified Fluid	345
(4) Stability of an Interface Between a Liquid and a Gas Stream	347
(i) Subsonic Gas Flow	349
(ii) Supersonic Gas Flow	350
VI. Capillary Instability of a Liquid Jet	351
VII. Stability of Parallel Flows	354
(1) The Orr–Sommerfeld Equation	355
(2) The Inviscid Solutions	357
(3) The Initial-Value Problem: Case–Dikii Theory	360
(i) Plane Couette Flow	363
(a) The Normal Mode Approach	363
(b) The Initial-Value Problem Approach	363
(c) Convection of an Initially Concentrated Vorticity	366
(4) Inviscid Stability Theory	368
(i) Discontinuities in the Mean Flow	368
(ii) Odd and Even Solutions	369
(iii) Self-excited and Damped Disturbances	370
(iv) Local and Global Necessary Conditions for the Existence of Non-Neutral and Neutral Modes	371
(v) Howard's Semi-Circle Theorem	373
(vi) Sufficient Conditions for the Existence of Self Excited and Neutral Modes	374
(5) Viscous Theory	379

(i) Heisenberg Criterion	381
(ii) General Characteristics of the Neutral Stability Curve	382
(iii) The Stokes Lines	385
Part 6. Dynamics of Turbulence	
I. The Origin and Nature of Turbulence	389
II. A Statistical Formalism	390
III. The Probability Density	391
IV. The Auto-Correlation	393
V. The Central Limit Theorem	396
VI. Symmetry Conditions	398
VII. Spectral Theory	399
VIII. Heisenberg's Theory	400
IX. Kolmogorov's Universal Equilibrium Theory	403
X. Taylor's Correlation Theory of Homogeneous, Isotropic Turbulence	404
XI. Von Karman–Howarth Equation	411
XII. Turbulent Dispersion: Lin's Theory	413
Bibliography	417
Subject Index	425
