CONTENTS

Introduction 1

I. Some equations and formulae of the theory of elasticity 4
1. Sets of differential equations 4
2. Fundamental solutions 10
3. Generalized fundamental solutions 15
4. Fundamental solutions of the first and second kind 17
5. Fundamental solutions of the third kind 21
6. Elastic potentials of an isotropic body 24
7. Formulae similar to the Poisson formula 30

II. Integral equations of boundary-value problems for homogeneous bodies 37
1. Boundary properties of the potentials 37
2. Definition of the boundary-value problems and reduction to integral equations 41

III. Conditions at infinity. Uniqueness theorems 45
1. Non-uniqueness solutions of the oscillation equation 45
2. Radiation condition 49
3. Betti's formula for an infinite region 54
4. Uniqueness theorems for homogeneous and non-homogeneous media 57

IV. Integral equations of boundary-value problems for non-homogeneous bodies 64
1. Formulation of the boundary value problems 64
2. The integral equations of problem A 65
3. Integral equations of the problems B_1 and B_2 72
4. Integral equations for the static problems B_1 and B_2 74
5. Integral equations of the static problems C_1 and C_2 79
6. Case of equal Poisson ratios 80
7. Some other conditions of contact. Cases of effective solutions 83

V. Elements of the theory of multi-dimensional singular integral equations 86
1. Introduction 86
2. Liapunov surfaces. Principal value of the singular integral 86
3. Classification of the kernels 90
4. Giraud's theorems 92
5. Transformation to local coordinates 94
6. Problem of regularization 97

7. Theorems on symbols 101
8. The local-regularization operator 107
9. The global-regularization operator 115
10. The functional equations of the resolvent, first Fredholm theorem 116
11. Consequences from the functional equations of the resolvent 121
12. Second Fredholm theorem 124
13. Elements of tht theory of the resolvent. 129
14. Third Fredholm theorem 131

VI. Existence theorems. Homogeneous media 134
1. Properties of the resolvent 134
2. Existence theorems for the solutions of the static problems (D_i) and (T_a) 138
3. The homogeneous static problems (D_a°) and (T_i°) 139
4. Solution of the elastostatic problem of Robin 142
5. Existence theorems for the static problems (D_a) and (T_i) 142
6. Existence theorems for the problems (M_i) and (M_a) 145
7. The existence proof of the static Green tensors 145
8. The homogeneous dynamic problems (D_i°) and (T_i°). Spectra of proper frequencies 153
9. Generalized theorem of Liapunov-Tauber 155
10. The relation between the solutions of the homogeneous problems and equations (D_a°), (T_i°) and (T_a°), (D_i°) 158
11. Analysis of the poles of the resolvents 163
12. Existence theorems for the dynamic problems (D_a) and (T_a) 166
13. Existence theorem for the external mixed dynamic problem (M_a) 169
14. Remarks concerning multiple poles 172

VII. Existence theorems. Non-homogeneous media 173
1. The case of equal Poisson ratios. Existence theorem 173
2. Application of the successive approximation method 178
3. Existence theorems for problems B_1 and B_2 179
4. Existence theorem for problem A in the general case 181
5. Existence theorems for the dynamic problems B_1 and B_2 188
6. The equivalence theorems. Some auxiliary lemmas 189
7. Equivalence theorem for the problem A 194
8. Equivalence theorems for the dynamic problems B_1 and I 198
9. Equivalence theorems for the static problems B_1 and B_2 201

VIII. Approximate solutions 208
1. Introduction 208
2. Diffraction of elastic waves 209
3. Approximate solution of problem (D_i) 215
4. Approximate solution of statical problem (T_i) 218
5. Approximate solution of problem (D_a) 221
6. Approximate solution of problem (T_a) 224
7. Approximate construction of Green tensors 226

On the approximate solution of boundary-value problems for multiply-connected regions 226
9. Solution of some concrete problems for a doubly-connected region 226
10. Solution of the first fundamental boundary-value problem for the doubly-connected region 231
11. Solution of the second fundamental boundary problem for the doubly-connected region 233
12. Mixed problem for the doubly-connected region 237
13. The sound dispersion problem 238
14. Existence theorem for the inverse operator 240
15. Estimates of errors. Rapidity of convergence 243
16. Numerical examples. Solution of Gauss' functional equation 246
17. Numerical examples. Solution of the Dirichlet problem for an elliptic region 251
