NOTES ON ARRANGEMENT xix

I. SOME GENERAL PRINCIPLES

1. Prologue	1
2. Physical scales	1
3. Laminar and turbulent flow	3
4. The Navier–Stokes equations of motion	5
5. Dynamical equations for an incompressible fluid	7
6. Conditions at boundaries	7
7. Streamlines in steady flow. The equation of continuity. Stream functions	9
8. Dynamical similarity. Non-dimensional coefficients. Reynolds number	10
9. Vorticity	15
10. The boundary layer and wake	17
11. Prandtl's boundary-layer approximation	20
12. General equations for two-dimensional boundary layers	21
13. Inviscid flow	24
14. Irrotational flow	26
15. Steady flow	27
16. The equations for steady incompressible flow	29
17. Two-dimensional flow. Symmetrical flows	30
18. Vortex lines. Vortex tubes. Circulation	32
19. Concentrated vortices. Vortex sheets. Induced velocity	34
20. The velocity potential in irrotational flow	37
21. The complex potential in two-dimensional irrotational flow	38
22. The two-dimensional irrotational flow of a uniform stream past a closed body	39
23. Singular solutions of Laplace's equation in three-dimensional flow	43
24. Some general characteristics of the flow in a boundary layer	44
25. The laminar boundary layer. Free and forced transition	48
26. The nature of transition	52
27. Equations for two-dimensional turbulent boundary layers	54
28. Physical characteristics of a turbulent boundary layer. Velocity profiles	56
29. Turbulent flow in pipes and channels	58
30. Equations of motion in general orthogonal coordinates	59

II. THE CALCULATION OF THE BOUNDARY LAYER	
1. Introduction	61
2. The laminar boundary layer	61
3. The transition region	64
4. The momentum integral equation in turbulent flow	65
5. Turbulent flow on a flat plate	67
6. Velocity profiles in turbulent flow on a flat plate	68
7. Experimental methods of measuring skin friction	71
8. Theoretical methods of predicting the skin friction on a flat plate	72
9. Velocity profiles in turbulent flow in a variable pressure	76
10. Skin friction in a variable pressure	78
11. Theoretical methods of predicting the momentum thickness	80
12. The distribution of shear stress within a turbulent boundary layer	82
13. The energy equation	84
14. Empirical equations for the form parameter	85
15. Summary of the calculation of the characteristics of a turbulent boundary layer	88
16. The turbulent boundary layer in a linear pressure gradient	88
17. The boundary layer on a porous surface	89
18. The boundary layer in axi-symmetric flow	91
III. THEORETICAL MODELS OF REAL FLOWS	
1. Introduction	92
2. Unseparated flow. The first approximation for the inviscid flow	92
3. Unseparated uniform flow past aerofoils. The first inviscid approximation	93
4. Unseparated uniform flow past wings. The first inviscid approximation	95
5. The first approximation for the boundary layer	98
6. The interaction of theory and experiment	100
7. The iterative procedure. The second approximations	101
8. Limited separation. Bubbles	102
9. Well-separated flow. Wakes	103
10. Cavities in liquids	107
11. Unsteadiness	109
IV. UNIFORM INVISCID FLOW PAST AEROFOILS	
1. Introduction	112
2. Unmixed boundary conditions	112
3. Technical terms, notation, and geometrical properties of aerofoils	113
4. The lift slope	114
5. Some special flows	115
6. Poisson's integral formulae	116

7. Computation of Fourier conjugates and associated formulae	119
8. Thin aerofoils. Linearized theory	120
9. Linearized theory. The fairing	122
10. Linearized theory. The camber line	123
11. Linearized theory. Overall aerodynamic properties	124
12. The velocity distribution on an arbitrary aerofoil. Theodorsen's theory	125
13. Goldstein's approximations to Theodorsen's theory	128
14. Non-linear theories. Lighthill (1951)	130
15. Non-linear theories. Weber (1953, 1955)	131
16. Non-linear theories. Spence and Routledge (1956)	136
17. Aerofoil design	138
18. Aerofoil design. Goldstein (1952)	140
19. Aerofoil design. Thwaites (1945 <i>a</i>)	142
20. Aerofoil design. The theory of Lighthill (1945 <i>b</i>)	143
21. Applications of Lighthill's theory	145
22. Aerofoils for which the lift is independent of incidence	147
23. Mixed boundary conditions	149
24. Separated wakes	150
25. The function σ	152
26. The formula of Schwarz-Christoffel	153
27. The classical theory for rectilinear boundaries	154
28. Curved boundaries. Inverse methods	156
29. Curved boundaries. The methods of Levi-Civita and Villat	158
30. Two theorems concerning functions analytic within an infinite strip	160
31. The general integral equation for infinite wakes	162
32. The iterative solution of the integral equation	164
33. The free streamlines near a separation point	165
34. The free streamlines far downstream	166
35. The pressure distribution in the wake	167
36. Lift and drag in Kirchhoff flow	168
37. The design of aerofoils with mixed boundary conditions	170
38. Riabouchinsky flow	172
39. Flow through channels	173
40. Concluding remarks	174
V. UNIFORM VISCOUS FLOW PAST AEROFOILS	
1. Introduction	176
2. Thin aerofoils at low incidence. The extended Kutta-Joukowski hypothesis	177
3. Drag. The first approximation	179
4. Drag. Other methods for the first approximation	184
5. The second inviscid approximation for symmetrical aerofoils at zero lift. Displacement flux method	187

6. The second inviscid approximation for symmetrical aerofoils at zero lift. Other methods	189
7. The second inviscid approximation for aerofoils at incidence	190
8. Drag. The second approximation	190
9. The calculation of lift and its relationship with circulation	191
10. Lift. The first approximation	194
11. Lift. The second approximation in unseparated flow	195
12. Drag in well-separated flow	198
13. Lift in well-separated flow	198
14. Characteristics of flow near the stall.	200
VI. BOUNDARY-LAYER CONTROL	
1. Introduction	206
2. Slotted wings. Leading-edge slats and trailing-edge flaps	207
3. Turbulent mixing. Vortex generators	210
4. Turbulent mixing. Wedges and ramps	212
5. Turbulent mixing. Air jets	213
6. Moving surfaces	215
7. The use of auxiliary power. The power required for area and slot suction	217
8. Area suction	220
9. Area suction near the leading edge of conventional aerofoils. Increase of maximum lift	222
10. The Thwaites flap. Lift independent of incidence	226
11. Area suction on conventional aerofoils to obtain low drag	229
12. Suction through perforated surfaces	231
13. Slot suction	232
14. Slot suction near the leading edge. Increase of maximum lift of conventional aerofoils	233
15. Slot suction near the leading edge. Aerofoils specially designed for high lift	236
16. Slot suction on conventional aerofoils to obtain low drag	239
17. Slot suction on aerofoils specially designed for very low drag	243
18. Suction on trailing-edge flaps. High lift	249
19. Blowing on trailing-edge flaps. High lift	250
20. The jet flap. Lift independent of incidence	252
VII. THE DISPLACEMENT EFFECT OF WINGS IN UNIFORM FLOW	
1. Technical terms, notation, and geometrical properties of wings	255
2. Introduction	257
3. Displacement flows	257
4. Linearized theory	260
5. Straight wings	263

6. Slender-body theory	267
7. Infinite sheared wings	273
8. The centre section of swept wings	277
9. The tips of a wing	284
10. Wings of general planform	287
VIII. THE LIFTING EFFECT OF WINGS IN UNIFORM FLOW	
1. Physical characteristics. Lift and vorticity. Theoretical models	291
2. Physical characteristics. Displacement effects. Drag	295
3. Some properties of vortex sheets. Applications to lift curves	296
4. Bound vorticity for a two-dimensional flat plate	299
5. Equations for the representation of a lifting wing by a vortex sheet	300
6. Lift, and drag due to lift	302
7. Formulation of the main problems	304
8. The general solution for unswept wings of large aspect ratio	305
9. Discussion of the classical solution	307
10. The elliptic wing of large aspect ratio	310
11. The Trefftz plane	311
12. Wings of small aspect ratio	313
13. Infinite sheared wings	319
14. The centre section of swept wings of infinite span	320
15. The effect of finite aspect ratio	325
16. General characteristics. Various drag forces	326
17. Wings of general planform and moderate aspect ratio	330
18. Numerical methods for solving the spanwise loading equation	335
19. The numerical method of Multhopp (1938 <i>a</i>)	337
20. Approximate solutions for wings with special planforms	340
21. Approximate solutions for wings of arbitrary planform	348
22. Cambered wings	352
23. The parabolic camber	354
24. A family of camber lines of known loading	355
25. The effects of camber on wings of small aspect ratio	358
26. Some considerations in the design of wings	359
27. The displacement effect of thick wings	365
IX. UNIFORM FLOW PAST BODIES OF REVOLUTION	
1. Introduction	369
2. The first inviscid approximation for the flow past ellipsoids of revolution	370
3. Stokes's stream function	373
4. The first inviscid approximation for the flow past a given body. Kaplan's method	373

5. A method based on conformal transformation	375
6. The representation of a body in longitudinal flow by distributions of singularities	377
7. The representation of a body by an axial distribution of sources	379
8. The representation of a body by source rings	380
9. The representation of a body by an axial distribution of doublets	382
10. The representation of a body by vortex rings	384
11. Slender-body theory	385
12. The problem of design	389
13. The representation of a body in lateral flow by distributions of singularities	390
14. The lateral flow past a slender body	393
15. The pressure distribution and forces on a body of revolution in a uniform stream	394
16. Lift, drag, and moments	399
17. Comparisons between the first inviscid approximation and experiment	401
18. Drag. The first approximation	403
19. Bodies at low incidence. Lift	405
20. Bodies at moderate incidence	409
21. The forces on a body at moderate incidence	414
22. Flow past rotating bodies of revolution	418
X. UNIFORM FLOWS PAST JOINED BODIES	
1. Introduction	422
2. The displacement flow of two intersecting unswept wings	423
3. The displacement flow of two intersecting swept wings	427
4. The displacement flow of a straight wing intersecting a body	430
5. The displacement flow of a swept wing intersecting a body	434
6. Wings with constant spanwise lift on a fuselage at zero incidence	437
7. Wings with a given spanwise distribution of lift on a fuselage at zero incidence	440
8. The determination of the spanwise distribution of lift of a wing on a fuselage at zero incidence	443
9. The lifting wing on a fuselage at incidence	446
10. Some extensions of the theory of wing-body combinations at incidence	448
11. Slender-body theory	451
12. Induced drag	454
13. Minimum induced drag	456
14. Some other combinations of bodies and lifting surfaces	457
XI. ROTARY FLOWS	
1. Introduction	463
2. The axial-flow compressor	464

CONTENTS

xvii

3. Theoretical models of flow in an annulus	467
4. Equations of motion and some general theorems	469
5. Equations for the total pressure	472
6. Radial equilibrium. The pressure distribution	473
7. Free-vortex flow	474
8. Approximate solutions of two-dimensional flow. Mean-value and settling-rate rules	475
9. Approximate solutions of axi-symmetric flow. Mean-value and settling-rate rules	479
10. Exact solutions for actuator disks	481
11. Rotating flow in pipes in the absence of actuator disks	484
12. Approximate solutions for a single actuator disk of given geometrical characteristics	486
13. Interference effects	488
14. Theories based on radial equilibrium at blade edges	490
15. The experimental verification of the various theories	493
16. Some considerations in design	495

XII. SOME MISCELLANEOUS TOPICS

1. Introduction	498
2. The theoretical model of a two-dimensional wing with jet flap	500
3. The calculation of lift for the two-dimensional jet flap	501
4. The theoretical model of a three-dimensional wing with jet flap	505
5. The calculation of lift for the three-dimensional jet flap	506
6. Wings with non-planar vortex sheets	508
7. The rolling-up of a trailing vortex sheet	509
8. Wings with vortex sheets springing from the leading edge	511
9. Wings with bubbles. Physical characteristics	516
10. Wings with bubbles. Analytical methods	519
11. Non-planar lifting systems. Biplanes and annular aerofoils	523
12. Non-planar lifting systems. Ground interference	527
13. Non-planar lifting systems. Cascades	530
14. General relations for inviscid flow through a cascade	532
15. Conformal transformations for cascades	533
16. Flow past cascades of flat plates	535
17. Various methods of deriving cascades of aerofoils of non-zero thickness	537
18. Various methods of solving the flow past a cascade of given aerofoils	540
19. Some experimental results for cascades	541
20. The velocity field of a wing	544
21. Non-uniform mainstreams. The effects of spanwise variations in the stream	548

22. Non-uniform mainstreams. The effects of variations in the stream in the lift direction	549
23. Non-uniform mainstreams. Bodies within boundary layers	550
24. Experiments on aerofoils and cylinders in shear flow	551
25. Experiments on excrescences in boundary layers	553
26. Experiments on pitot tubes in boundary layers	554
27. Theoretical considerations of displacement effect: the limited value of two-dimensional treatments	558
28. The displacement effect for a circular cylinder in two-dimensional shear flow	559
29. The displacement effect for other two-dimensional shapes in shear flow	562
30. The displacement effect of a thin-walled two-dimensional pitot tube	563
31. Theoretical considerations of displacement effect for three-dimensional bodies in shear flow	567
32. The displacement effect of a sphere in shear flow	569
