PREFACE.	vii
FOREWORD BY L. PRANDTL.	xv
INTRODUCTION	1

PART ONE THE STATICS OF LIQUIDS AND GASES

CHAPTER I

EQUILIBRIUM AND STABILITY	7
1. The Conditions under Which Liquids and Gases Can Be Treated as Continua.	7
2. The Concept of Fluid Pressure.	11
3. Relation between Pressure Distribution and Volume Force	14
4. Stable, Unstable, and Neutral Equilibrium	17
5. Equation of Hydrostatic Pressure	18
6. Applications of the Pressure Equation; Communicating Vessels	20
7. Hydrostatic Pressure on Walls and Floors.	22
8. Hydrostatic Lift and Stability.	25
9. Calculation of the Metacentric Height	26

CHAPTER II

APPLICATION OF THE PRESSURE EQUATION TO PERMANENT GASES. STABILITY OF AIR MASSES	29
10. Equation of State for Permanent Gases.	29
11. Uniform Atmosphere.	30
12. Isothermal Atmosphere.	31
13. Polytopic Atmosphere	32
14. Determination of the Exponent n of the Polytrope.	34
15. Significance of the Temperature Gradient in Relation to the Stability of Air Masses	35
16. Influence of Humidity	37
17. Concept of Potential Temperature	39
18. Origin of Clouds.	42

CHAPTER III

STATIC LIFT ON GAS-FILLED AIRCRAFT.	47
19. Pressure on the Balloon Wall	47

	PAGE
20. Lift of a Gas-filled Balloon	48
21. Effect of Temperature on Lift	49
22. Equilibrium of Forces on a Balloon.	50
23. Stability of a Balloon in Taut State under Adiabatic Conditions	51
24. Stability of a Balloon in the Limp State under Adiabatic Conditions	53
25. Effect of Temperature Changes at Constant Pressure on a Balloon in the Taut State.	55
26. Effect of Temperature Changes at Constant Pressure on a Balloon in the Limp State.	56
27. Causes of Heat Changes; Behavior of Balloon during Travel .	58
CHAPTER IV	
SURFACE TENSION	60
28. Physical Basis.	60
29. Relation between Surface Tension and Pressure Difference across a Surface	61
30. Surface Tension at Place of Contact between Several Media .	62
31. Surface Effects under the Action of Gravity.	63
32. Capillarity	64
PART TWO	
KINEMATICS OF LIQUIDS AND GASES	
CHAPTER V	
METHODS OF DESCRIPTION.	69
33. Lagrangian Method.	69
34. Eulerian Method and Its Connection with That of Lagrange .	71
35. Streamlines and Paths of Particles; Steady Flow.	72
36. Streak Lines.	73
37. Significance of System of Reference in Interpretation of the Form of Motion	74
38. Construction of Path and Streak Lines	75
39. Stream Tubes	77
CHAPTER VI	
GEOMETRY OF THE VECTOR FIELD.	78
40. Linear Vector Function of Position.	78
41. Geometrical Significance of the Individual Quantities of a Matrix Characterizing a Velocity Field	79
42. Shearing and Rotating Velocities.	81
43. The Concept of the Tensor	83
44. Splitting a Tensor into a Symmetrical and Antisymmetrical Part	84
45. Stokes's Theorem	86
46. Gauss's Theorem.	89
47. Introduction of the Operator ∇	91

CONTENTS

xi
PAGE

CHAPTER VII

ACCELERATION OF A FLUID PARTICLE	95
48. Velocity Change of a Fluid Particle as a Function of the Time and the Velocity Field	95
49. The Substantial Differential Is the Sum of the Local and Convective Differentials	95
50. Kinematic Boundary Conditions; Theorem of Lagrange.	97
51. Liquids and Gases Are Not to Be Considered as Ideal Media but as Quasi-continua.	98

CHAPTER VIII

EQUATION OF CONTINUITY	100
52. Incompressible Homogeneous Fluids	100
53. Eulerian Derivation of the Continuity Equation for Gases.	101
54. The General Lagrangian Equation of Continuity.	103

PART THREE

THE DYNAMICS OF NON-VISCOUS FLUIDS

CHAPTER IX

THE EULERIAN EQUATION AND ITS INTEGRATION ALONG A STREAMLINE 107	
55. General Remarks on the Action of Fluid Viscosity	107
56. Euler's Equation.	110
57. Integration of Euler's Equation along a Streamline.	112
58. Bernoulli's Equation	114
59. Applications of the Bernoulli Equation	116

CHAPTER X

POTENTIAL MOTION.	122
60. Simplification of Euler's Equation and Integration on Assuming a Velocity Potential	122
61. Connection between the Integral of Euler's Equation for Potential Motion and the Corresponding Integral along a Streamline.	126
62. Equations Defining Potential and Pressure Functions.	128
63. The Potential Function for Incompressible Fluids	129
64. The Potential Function When the Velocity w Is Very Small.	130
65. The Potential Function for Steady Motion	132
66. The Potential Function for the One-dimensional Problem.	138
67. Simple Examples of Potential Motion for Incompressible Fluids	139
68. The Source and Sink Potential.	144
69. Description of Motion about a Body of Revolution by the Method of Sources and Sinks	146
70. The Motion about a Sphere; Doublets	149
71. The Potential of a Rectilinear Vortex.	153
72. Difference between Potential Motion with Circulation and a Motion with Rotation	154
73. The Interpretation of Potential as Impulsive Pressure	155

	PAGE
CHAPTER XI	
TWO-DIMENSIONAL POTENTIAL MOTION	157
74. The Real and Imaginary Parts of an Analytic Function of Complex Argument Are Solutions of Laplace's Differential Equation	157
75. The Cauchy-Riemann Differential Equations and Their Physical Interpretation	158
76. The Stream Function	161
77. Examples of the Application of the Stream Function $F(z)$ to Simple Problems of Motion in Two Dimensions	162
78. The Motion Round a Straight Circular Cylinder	166
79. The Fundamentals of Conformal Transformation	169
80. Applications of Conformal Transformation	172
81. The Hodograph Method	178
82. Discontinuous Fluid Motions	183
CHAPTER XII	
VORTEX MOTION	189
83. The Kinematics of Vortex Motion	189
84. Thomson's Theorem on the Permanence of Circulation	191
85. Extension of Thomson's Theorem to the Case of Non-homogeneous Fluids by V. Bjerkness	194
86. The Dynamics of Vortex Motion	196
87. The Vortex Theorems of Helmholtz	197
88. The Velocity Field in the Neighborhood of an Isolated Vortex; the Law of Biot and Savart	201
89. Simplified Construction of a Vortex Line by Assuming a Core of Constant Rotation	207
90. The Motion and Mutual Influence of Single Vortices	208
91. Pressure Distribution in the Neighborhood of a Rectilinear Vortex	213
92. The Relation between Vortex Motion and the Surface of Discontinuity or Separation	214
93. The Formation of Surfaces of Discontinuity	216
94. Instability of the Surface of Discontinuity	221
CHAPTER XIII	
THE INFLUENCE OF COMPRESSIBILITY	224
95. General Remarks about the Justification for Treating Gases as Incompressible Fluids	224
96. Compressibility in Bernoulli's Equation	225
97. The Effect of Compressibility on the Formula for Stagnation Pressure	227
98. Compressibility in the Equation of Continuity	229
99. The Effect of Compressibility on the Streamlines When the Velocity Is Less than That of Sound	231
CHAPTER XIV	
THEOREMS OF ENERGY AND MOMENTUM	233

CONTENTS

xiii

	PAGE
100. The Momentum Theorem for Steady Motion	233
101. Extension of the Momentum Theorem to Fluid Motion with a Steady Mean Flow	239
102. Applications of the Theorem of Momentum	240
103. The Energy Theorem for Non-steady Motion of Incompressible Fluids	246

CHAPTER XV

THE EQUATION OF NAVIER-STOKES FOR VISCOUS FLUIDS	251
104. The Fundamental Equation of Fluid Mechanics	251
105. Decomposition of the Total Surface Force into the Elements of a Stress Tensor	252
106. Relation of the Elements of the Stress Tensor to the Corre- sponding Rates of Change of Deformation	253
107. Relation between the Stress Tensor and the Velocity Tensor	257
108. The Equation of Navier-Stokes	258
109. Discussion of the Navier-Stokes Equation	260
110. The Differential Equation of Creeping Motion	261
111. Oseen's Improvement of the Theory	264
INDEX	267
