Introduction	1
1. The Action Principles in Mechanics	3
2. Application of the Action Principles	15
3. Jacobi Fields, Conjugate Points	35
4. Canonical Transformations	47
5. The Hamilton-Jacobi Equation	61
6. Action-Angle Variables	75
7. The Adiabatic Invariance of the Action Variables	97
8. Time-Independent Canonical Perturbation Theory	109
9. Canonical Perturbation Theory with Several Degrees of Freedom ..	117
10. Canonical Adiabatic Theory	131
11. Removal of Resonances	137
12. Superconvergent Perturbation Theory, KAM Theorem (Introduction)	147
13. Poincaré Surface of Sections, Mappings	155
14. The KAM Theorem	165
15. Fundamental Principles of Quantum Mechanics	173
16. Examples for Calculating Path Integrals	179
17. Direct Evaluation of Path Integrals	199
18. Linear Oscillator with Time-Dependent Frequency	209
19. Propagators for Particles in an External Magnetic Field	225
20. Simple Applications of Propagator Functions	231
21. The WKB Approximation	247
22. Partition Function for the Harmonic Oscillator	257
23. Introduction to Homotopy Theory	263
24. Classical Chern-Simons Mechanics	269
25. Semiclassical Quantization	281
26. The “Maslov Anomaly” for the Harmonic Oscillator	287
27. Maslov Anomaly and the Morse Index Theorem	295
28. Berry’s Phase	301
29. Classical Analogues to Berry’s Phase	311
30. Berry Phase and Parametric Harmonic Oscillator	323
