

Table of Contents

Preface	xi
General Introduction	xiii
Chapter 1 / Quantization of Translatory Motion	1
1.1. Background Remarks on Time and Space	1
1.2. The Statistical Nature of Position, Velocity, and Momentum	2
1.3. A State Function Governing Translation	4
1.4. Diffraction by Neighboring Parallel Slits	7
1.5. Diffraction by Molecules	10
1.6. Dependence of the Function for a Definite Energy State on Time	13
1.7. Independent Movements within a State	14
1.8. The Continuum of Translational States	17
1.9. Periodic, Rectangularly Symmetric, Free Motion	18
1.10. Enumerating and Filling Translational States	21
1.11. Translational Energy of an Ideal Gas	24
1.12. Standing-Wave Translational Functions	26
1.13. Confined Rectangularly Symmetric Motion	28
1.14. Attenuated Motion	29
1.15. Joining Regions of Differing Potentials	32
Discussion Questions	33
Problems	35
References	36
Chapter 2 / Quantization of Rotatory Motion	38
2.1. Separation of Different Modes of Motion from Each Other	38
2.2. One-Particle Model for a Linear Rotator	39
2.3. Variation of Ψ in a Spherically Symmetric Field	42
2.4. The Rotational State Described by the Traveling Wave	44
2.5. Quantization of the Simple Rotator	46
2.6. Standing-Wave Rotational Functions	47
2.7. Energy Levels for a Two-Dimensional Rotator	49

2.8.	Rotational Spectrum of a Linear Molecule	52
2.9.	Broadening of Spectral Lines	56
2.10.	Angular Momenta and the Resultant Energies for a Nonlinear Rotator	57
2.11.	Quantizations of Prolate and Oblate Rotators	58
2.12.	The Asymmetric Rotator	61
2.13.	Dependence of Ψ on θ in a Spherically Symmetric Field	63
2.14.	Explicit State Functions for Angular Motion in a Central Field	68
	Discussion Questions	72
	Problems	74
	References	75
Chapter 3 / Quantization of Vibratory Motion		76
3.1.	Additional Concerted Movements	76
3.2.	Vibrational Kinetic and Potential Energies for a Diatomic Molecule	77
3.3.	Derivatives of the State Function in Regions where the Potential Energy is not Constant	80
3.4.	The Schrödinger Equation for Simple Harmonic Motion	82
3.5.	Suitable State Functions for the Harmonic Oscillator	83
3.6.	Properties of the Harmonic Oscillator ψ_v 's	86
3.7.	Transitions between Vibrational Energy Levels	90
3.8.	Vibrational Spectrum of a Diatomic Molecule	91
3.9.	Anharmonicities and their Net Effects	95
3.10.	Spectra of Polyatomic Molecules	99
3.11.	Raman Spectra	100
3.12.	The State Sum for a Vibrational Mode	101
3.13.	Operator Formulations of the Harmonic Oscillator Equation	103
	Discussion Questions	105
	Problems	107
	References	108
Chapter 4 / Radial Motion in a Coulombic Field		110
4.1.	A More Complicated Oscillation	110
4.2.	Representing the Axial and Angular Motions of Two Particles Bound Together	111
4.3.	Differential Equations Governing Variations in a State Function	113
4.4.	An Orthogonal-Coordinate Representation of ∇^2	116
4.5.	Separating the Radial Variable from the Angular Variables in the Schrödinger Equation	120
4.6.	The Radial Equation for an Electron – Nucleus System	124
4.7.	Laguerre Polynomials	127
4.8.	Quantization of the Radial Motion	129
4.9.	Electronic Spectrum of a Hydrogen-like Atom or Ion	133
4.10.	Uninuclear Multi-electron Structures	136

4.11. Useful Operator Formulations of the Radial Equation	137
Discussion Questions	139
Problems	140
References	142
Chapter 5 / Quantum Mechanical Operators	143
5.1. Dependence of Observables on the State Function	143
5.2. Eigenvalue Equations	143
5.3. Formula for the Expectation Value	149
5.4. The Dirac Delta	151
5.5. Operators for Momenta and Energy	154
5.6. The Hamiltonian Operator	157
5.7. Shift Operators for the Harmonic Oscillator	157
5.8. Nodeless Solutions	159
5.9. Acceptable Wavy Solutions	160
5.10. The Inverse Operator as the Adjoint of an Operator	163
5.11. Shift Operators for a Hydrogen-like Atom	164
5.12. Spontaneous Decay of an Unstable State	166
Discussion Questions	168
Problems	170
References	171
Chapter 6 / Wave Packets, Potentials, and Forces	173
6.1. Mixing Wave Functions	173
6.2. Fourier Series and Fourier Integrals	175
6.3. Broadening of a Level Caused by Instability	179
6.4. A Gaussian Wave Packet and its Wavevector Representation	181
6.5. An Arbitrary Superposition of Simple Planar Waves	183
6.6. The De Broglie Angular Frequency	186
6.7. Variations of a Wave Function and Observable Properties with Time	189
6.8. Generalizing Newton's Laws	192
6.9. Scalar and Vector Potentials	193
6.10. The Lorentz Force Law	195
6.11. Phase Changes along a Given Path through a Field	198
6.12. Quantization of Magnetic Flux	200
6.13. Effect of a Field on Two-Slit Diffraction	201
6.14. Magnetic and Electric Aharonov–Bohm Effects	203
Discussion Questions	206
Problems	207
References	209
Chapter 7 / Angular Motion in a Spherically Symmetric Field	212
7.1. Conditions on the Angular Eigenfunctions	212
7.2. The Homogeneous Polynomial Factor	212

7.3.	Solutions Derived from the Reciprocal of the Radius Vector	216
7.4.	Dependence on the Azimuthal Angle	218
7.5.	Dependence on the Colatitude Angle	220
7.6.	Normalizing the Angular Eigenfunctions	226
7.7.	Mutual Orthogonality of the Angular Eigenfunctions	232
7.8.	Spherical-Harmonic Analysis of a Pure Planar Wave	233
7.9.	Schrödinger Equation for Radial Constituents of Free Motion	235
	Discussion Questions	237
	Problems	239
	References	240
Chapter 8 / Operators for Angular Momentum and Spin		242
8.1.	Rotational States, Spin States, and Suitable Composites	242
8.2.	The Azimuthal-Angle Operator Governing Angular Momentum	243
8.3.	Cartesian Angular-Momentum Operators	244
8.4.	Expressions Governing Rotational Standing Waves	245
8.5.	Angular Momentum Shift Operators	247
8.6.	The Integral or Half-Integral of Quantum Number M	250
8.7.	Magnetic Energy Associated with an Angular Momentum	252
8.8.	Observing Spatial Quantization in a Beam	255
8.9.	Eigenoperators and Eigenfunctions for Spin	257
8.10.	Relating State Functions for Different Magnetic Quantum Numbers	262
8.11.	Combining Angular Momenta	266
	Discussion Questions	268
	Problems	270
	References	270
Chapter 9 / Propagation, Spreading, and Scattering		272
9.1.	The Current Associated with Propagation	272
9.2.	An Evolution Operator	274
9.3.	Spreading of a Gaussian Wave Packet	275
9.4.	Existence of Scattering Centers in Materials	277
9.5.	Cross Sections Presented by Scattering Centers	277
9.6.	Pure Outgoing, Incoming, and Standing Spherical Waves	282
9.7.	Possible Effects of Centers on the Partial Waves	284
9.8.	Contributions to Various Cross Sections	287
9.9.	A Classical Model for Scattering Centers	288
9.10.	Nuclear Radii	290
9.11.	Resonance	292
9.12.	The Resonant State with Reaction	294
9.13.	Singularity in the Partial Wave Amplitude Ratio at a Physical State	295
	Discussion Questions	297
	Problems	298
	References	299

Chapter 10 / Investigating Multiparticle Systems	302
10.1. Quantum Mechanical Particles and Quasi Particles	302
10.2. The Variation Theorem	303
10.3. Separation of Particle Variables	306
10.4. Indistinguishability of Identical Particles in a Quantal System	311
10.5. Fundamental Combinatory Rules	312
10.6. Symmetrizing and Antisymmetrizing Operations	316
10.7. Basis for the Pauli Exclusion Principle	317
10.8. Relating the Energy of a Plural Paired-particle System to One- and Two-Particle Effects	319
Discussion Questions	324
Problems	325
References	327
 Answers to Problems	 328
 Name Index	 332
 Subject Index	 333
