

CONTENTS

CHAPTER 1. REVIEW OF QUANTUM THEORY DEFINITIONS AND NOTATIONS	1
1-1 Operators	1
1-2 Linear operator algebra and matrix elements	2
1-3 Eigenfunctions, eigenvalues, and orthonormal sets	3
1-4 Commuting operators and simultaneous eigenfunctions	4
1-5 An example: the harmonic oscillator in one dimension	7
CHAPTER 2. COMMUTATION RULES	10
2-1 The fundamental commutator for angular momentum	10
2-2 Angular momentum and rotations of axes	12
2-3 Invariance of the Hamiltonian and of I^2 under rotations	16
CHAPTER 3. THE EIGENVALUES AND MATRIX ELEMENTS OF ANGULAR MOMENTUM	19
3-1 The eigenvalues of I_z and I^2	19
3-2 The matrix elements of M , N , and I_z	24
3-3 The Pauli spin operators	26
CHAPTER 4. MATRIX ELEMENTS OF SCALAR, VECTOR, AND TENSOR OPERATORS	29
4-1 Vector-angular momentum commutation relations and matrix elements	29
4-2 Tensor relations and matrix elements	37
CHAPTER 5. APPLICATIONS TO NUCLEAR MOMENTS AND TRANSITION PROBABILITIES	43
5-1 Nuclear magnetic interactions with a uniform magnetic field	43
5-2 Electric quadrupole moment	45
5-3 Quadrupole interaction between atomic electrons and nuclei	47
5-4 Landé g -factor for a two-component system	48
5-5 Equivalent operators in LS and jj coupling states	49
5-6 Intensity relations	50
5-7 Charge and supermultiplets	51
