Translator's Preface	vii
Contents	ix
Glossary of Symbols	xiii
Introduction	1
I. Quantum theory of free particles	5
§ 1. Mass points in classical physics	5
§ 2. The de Broglie quantum postulate for free mass particles	8
§ 3. Superposition of de Broglie waves	13
§ 4. Properties of special wave-packets	17
§ 5. The Heisenberg relations	21
§ 6. The approximate validity of Newton's first law	25
§ 7. The quantitative formulation of probability laws	27
§ 8. The Schrödinger wave equation	33
§ 9. The quantum theory of free particles and the laws of conservation of momentum and energy	38
II. Non-relativistic quantum theory of bound particles	41
§ 10. Bound particles in classical physics	41
§ 11. The Schrödinger equation and its connexion with the Hamilton equation	42
§ 12. The motion of wave groups under the influence of external forces	44
§ 13. The physical meaning of the wave function	46
§ 14. Probability density and probability current density	47
§ 15. The momentum probability distribution	49
§ 16. The uncertainty relations; the uncertainty in energy	50
§ 17. Energy eigenvalues and eigenfunctions	51
§ 18. Stationary states	58
§ 19. The superposition principle in quantum mechan- ics	61
§ 20. The representation of an arbitrary physical situa- tion as the superposition of stationary states	64

§ 21. Degenerate stationary states; degree of degeneracy	66
§ 22. Unnormalisable eigenfunctions of free particles	68
§ 23. Improper stationary states in an external field of force	72
§ 24. General discussion of eigenvalues and eigenfunctions	80
§ 25. Charged particles in an electromagnetic field	84
III. The non-relativistic treatment of the many-body problem	87
§ 26. The two-body problem	87
§ 27. The Schrödinger equation of many interacting particles	92
§ 28. The interpretation of the wave function	97
§ 29. Operators	100
§ 30. The generalised Ehrenfest theorem.	110
§ 31. The conservation of momentum	112
§ 32. Stationary states	116
§ 33. The law of conservation of energy; causality in quantum mechanics	120
IV. Transformation theory	124
A. General theory	
§ 34. Coordinate transformations	124
§ 35. The definability of mechanical quantities	126
§ 36. Eigenvalues and eigenfunctions corresponding to an observable	128
§ 37. Eigenvalues and eigenfunctions of finite Hermitean matrices	131
§ 38. The eigenfunctions of commuting Hermitean operators	139
§ 39. The distribution function of an observable; probability amplitudes	141
§ 40. Transformation of functions	146
§ 41. Transformation of operators; matrix representation of an observable	149
§ 42. The transformed Schrödinger equation	155
§ 43. The time dependence of observables	158

B. Examples	
§ 44. The probability distribution of coordinates and momenta; the probability current density.	162
§ 45. The eigenvalues and eigenfunctions of the angular momentum	168
§ 46. A particle in a central field of force; the hydrogen atom	180
V. Perturbation theory	188
§ 47. Introduction	188
§ 48. The perturbation of a non-degenerate discrete stationary state	189
§ 49. The perturbation of a degenerate discrete sta- tionary state	195
§ 50. Perturbation theory and infinitesimal trans- formations	198
§ 51. Method of approximate solutions; the variational principle.	202
§ 52. Expectation values and time averages	207
§ 53. The method of the variation of constants . .	209
§ 54. Variable fields of force; adiabatic theorem . .	214
§ 55. Time proportional transition probabilities. . .	218
Index	225
