

Contents

1. PLANCK'S RADIATION LAW AND THE EINSTEIN COEFFICIENTS	1
1.1. Density of field modes in a cavity	2
1.2. Quantization of the field energy	5
1.3. Planck's law	8
1.4. Fluctuations in photon number	11
1.5. Einstein's A and B coefficients	13
1.6. The case of thermal equilibrium	15
1.7. Theory of simple optical processes	17
1.8. Properties of the microscopic processes	18
1.9. Optical excitation of atoms	22
1.10. Macroscopic theory of absorption	24
1.11. Microscopic theory of absorption	26
1.12. Population inversion: the laser	30
1.13. Radiation pressure	33
2. QUANTUM MECHANICS OF THE ATOM–RADIATION INTERACTION	39
2.1. Time-dependent quantum mechanics	40
2.2. Form of the interaction Hamiltonian	42
2.3. The transition rate	45
2.4. Expression for the B coefficient	50
2.5. The Dirac delta-function	52
2.6. The optical Bloch equations	54
2.7. Rabi oscillations	56
2.8. Radiative broadening	59
2.9. Power broadening	63
2.10. Rabi oscillations with radiative damping	65
2.11. Collision broadening	70
2.12. Doppler broadening	72
2.13. Composite absorption lineshape	74
2.14. Bloch equations and rate equations	78

3. FLUCTUATION PROPERTIES OF CHAOTIC LIGHT	82
3.1. Spectrum of a fluctuating light beam	83
3.2. Model of a collision-broadened light source	85
3.3. First-order coherence and frequency spectrum	90
3.4. Young's interference fringes	92
3.5. Degree of first-order coherence	96
3.6. Intensity fluctuations of chaotic light	101
3.7. Degree of second-order coherence	105
3.8. Second-order coherence of chaotic light	107
3.9. Experiment of Hanbury Brown and Twiss	111
3.10. Higher-order coherence and polarization effects	116
4. THE QUANTIZED RADIATION FIELD	120
4.1. Potential theory for the classical electromagnetic field	121
4.2. The Coulomb gauge	123
4.3. The free classical field	126
4.4. The quantum-mechanical harmonic oscillator	129
4.5. Quantization of the field	134
4.6. Field commutation properties	137
4.7. The zero-point energy	139
4.8. The mode phase operators	141
4.9. Physical properties of the single-mode number states	144
4.10. The coherent photon states	146
4.11. Physical properties of the single-mode coherent states	148
4.12. The radiative density operator	152
4.13. Density operators for pure states	155
4.14. Statistical mixture states of the radiation field	157
5. INTERACTION OF THE QUANTIZED FIELD WITH ATOMS	162
5.1. Atomic multipole moments	162
5.2. The multipolar interaction Hamiltonian	166
5.3. The electric-dipole approximation	169
5.4. Second quantization of the atomic Hamiltonian	172
5.5. Photon absorption and emission rates	175
5.6. The photoelectric effect	178
5.7. The photon intensity operator	184
5.8. Transformation to the Schrödinger representation	187

5.9. General expression for radiative transition rates	191
5.10. Time-dependent perturbation theory	193
5.11. The Heisenberg representation	197
5.12. Time dependence of the atom–radiation system	199
5.13. The source-field expression	202
5.14. The interaction representation	206
6. PHOTON OPTICS	211
6.1. Quantum theory of Young’s interference experiment	211
6.2. Quantum degree of first-order coherence	216
6.3. Quantum degree of second-order coherence	219
6.4. Hanbury Brown and Twiss experiment with photons	222
6.5. Photon bunching and antibunching	226
6.6. Photon counting	229
6.7. Photon-count distributions for coherent and chaotic light	232
6.8. Quantum-mechanical photon-count distribution	238
6.9. Photon counting in the Michelson interferometer	242
6.10. Higher-order coherence and polarization effects	247
7. GENERATION AND AMPLIFICATION OF LIGHT	251
7.1. Single-mode photon rate equations	251
7.2. Steady-state solutions	255
7.3. Photon statistics of attenuated light	257
7.4. Photon statistics of amplified light	261
7.5. Laser threshold condition	263
7.6. Rate equations for the atoms	267
7.7. Rate equations for the laser photons	271
7.8. The laser photon distribution	273
7.9. Fluctuations in laser light	278
7.10. Multimode emission by a driven atom	284
8. RESONANCE FLUORESCENCE AND LIGHT SCATTERING	290
8.1. The scattering cross-section	292
8.2. Single-atom resonance fluorescence	295
8.3. Weak incident beam	299
8.4. Exactly-resonant incident beam	303
8.5. Multiatom resonance fluorescence	308

xiv *Contents*

8.6. The Kramers–Heisenberg formula	310
8.7. Elastic Rayleigh scattering	314
8.8. Inelastic Raman scattering	320
8.9. Two-photon cascade emission	326
9. NONLINEAR OPTICS	334
9.1. Double-beam two-photon absorption	335
9.2. Single-beam two-photon absorption	344
9.3. The nonlinear susceptibility	347
9.4. The stimulated Raman effect	351
9.5. Third-harmonic generation	357
9.6. Photon statistics and nonlinear optics	363
9.7. Photon statistics of double-beam two-photon absorption	366
9.8. Photon statistics of single-beam two-photon absorption	373
9.9. Photon statistics of the stimulated Raman effect	378
9.10. Conclusion	382
