

Contents—Part 2

Chapter III The Creation of Wave Mechanics	367
Introduction	367
III.1 Scientific Exchange with Planck and Einstein	371
Interaction with Colleagues in Zurich	371
Growing Reputation and the Solvay Conference of 1924	373
The Innsbruck <i>Naturforscherversammlung</i>	375
Planck's Lecture and Other Interesting Lectures	377
Einstein, the Nature of Light and Bose Statistics	381
First Correspondence with Einstein	385
Planck's Preliminary Response to Einstein	389
Schrödinger's Analysis of Entropy Definitions	391
Planck's Last Word	393
A New Stimulus from Einstein	397
The Energy States of the Ideal Gas	399
Continued Scientific Exchange with Berlin	402
III.2 First Steps Towards the Hydrogen Equation	404
Philosophical Interlude: Consciousness and Continuity	405
Lecture Course on Spectra	410
Obtaining the Thesis of Louis de Broglie	412
Phase Waves and Stationary Orbits of Atoms	415
New Description of Radiation and Exchange with Landé	417
The Zurich <i>Kolloquium</i>	419
Memorandum on the Eigenvibrations of the Hydrogen Atom	423
Solution of the Relativistic Hydrogen Equation	426
The Failure of the Relativistic Hydrogen Equation	430
On Einstein's Gas Theory	434
Application of the Darwin-Fowler Method	436
Phase Waves in Gas Theory	439
Relations Between Gas Theory and the Hydrogen Equation	442
III.3 The Nonrelativistic Hydrogen Equation	444
An Important Correspondence with Wien	446
On the Nature of Radiation and a Repetition of the Michelson Experiment	452
A Breakthrough During the Christmas Vacation	459
The Notebook on ' <i>Eigenwertproblem des Atoms. I</i> ' (First Part)	465
Assistance from Colleagues in Zurich	476
Quantization as a Variational Principle	486
Discrete and Continuous Eigenvalues of the Nonrelativistic Hydrogen Equation	490

III.4	Sources of Undulatory Mechanics	496
	Preliminary Arguments Given in the First Paper	497
	Louis de Broglie's Mechanical-Optical Analogy	502
	Hamilton's Optical-Mechanical Analogy	506
	Relations Between Wave and Geometrical Optics	514
	A Hertzian Formulation of General Relativity and the Mechanical-Optical Analogy	522
III.5	Foundations of Undulatory Mechanics	533
	First Response from Munich	534
	Relation to the Old Theory of Ritz?	538
	Preparations for the Second Communication	543
	Does the Scheme Presented Exhaust the Undulatory Content?	549
	The Mechanical Analogue of the Debye-Laue Construction	559
	Undulatory Mechanics and the Wave Equation	569
Chapter IV	Early Response and Applications	577
	Introduction	577
IV.1	The Scheme Starts to Work	579
	The Discovery of 'Hilbert's Mathematics'	579
	The Oscillator in Wave Mechanics	584
	Several Degrees of Freedom and Degeneracy	591
	The Rotator and the Diatomic Molecule in Wave Mechanics	593
	Undulatory Perturbation Theory	600
	The Transcription of Epstein's Calculation of the Stark Effect	604
	Perturbation Theory for Many Degrees of Freedom	610
IV.2	Response to Wave Mechanics I. The Early Phase	617
	Continuation of the Correspondence with Wilhelm Wien and Arnold Sommerfeld	618
	Letters to and from Berlin	622
	Some Penetrating Questions by Hendrik Lorentz	629
IV.3	Formal Equivalence of Wave Mechanics and the Quantum Mechanics of Born, Heisenberg, Jordan and Dirac	636
	First Hints of a Relation of Wave Mechanics to Quantum Mechanics	638
	A Paper by Lanczos on the Field-like Representation of Quantum Mechanics	642
	Operators and Equivalence of Wave and Matrix Equations	649
	A Letter by Wolfgang Pauli	655
	Pauli, Lanczos' Field-like Formulation and the Born-Wiener Approach	661
	A Combination of Schrödinger's and Lanczos' Theory	668
	The Solution of the Equations of Quantum Dynamics: Carl Eckart's Equivalence Demonstration	675
IV.4	Response to Wave Mechanics II. Applications and Extensions	684
	The Stuttgart Meeting: Talks by Fues and Wentzel	687
	Band Spectra in Undulatory Mechanics	689
	Intensity Calculations of Schrödinger, Pauli, Wentzel and Fues	698
	European-American Competition on the Stark Effect and the Hydrogen Spectrum	710
	Collision Processes in Wave Mechanics	723

Cracking the Helium Problem	735
The Advent of Fermi Statistics	746
Symmetry Properties of Wave Functions and Quantum Statistics	757
IV.5 Towards an Undulatory Interpretation of Atomic Phenomena	772
Early Expressions of Schrödinger's Undulatory View of Atomic Processes	775
Return to ' <i>Anschaulichkeit</i> ' in Atomic theory	780
The 'Real' Wave Equation: Time-Dependent Theory, Perturbation Scheme and Application to Dispersion Phenomena	785
The Physical Meaning of the Field Scalar and Schrödinger's Talks in Berlin and Munich	796
The Relativistic and Magnetic Field Equation	805
Schrödinger's Visit to Copenhagen	820
Two Crucial Problems: The Compton Effect and the Photoelectric Effect	828
Further Successes of Wave Mechanics in the Second Half of 1926	838
Schrödinger's Rising Fame: Continuing Problem of Interpretation, Visit to America and Berlin Professorship	855
References	869
Author Index	965
