CONTENTS

Acknowledgements		viii
1.	Preface cum introduction	1
2.	Classical solitons and solitary waves	9
	2.1. Introduction	9
	2.2. Solitary waves and solitons	10
	2.3. Some solitary waves in two dimensions	16
	2.4. Topological indices	31
	2.5. Solitons of the sine–Gordon system	34
3.	Monopoles and such	46
	3.1. On solutions in higher dimensions	46
	3.2. A Virial theorem	47
	3.3. The non-linear O(3) model: The isotropic ferromagnet	48
	3.4. The 'tHooft–Polyakov monopole	58
	3.5. More on monopoles and dyons	70
	3.6. Homotopy considerations in condensed matter systems	74
	3.7. Soliton–soliton interactions	80
4.	Classical instanton solutions	84
	4.1. What are instantons?	84
	4.2. Euclidean Yang–Mills configurations	86
	4.4. The Yang–Mills instantons	98
	4.4. Instantons of other models	111
	4.5. The CP_N model	115
5.	Quantisation of static solutions	124
	5.1. Introduction	124
	5.2. The central idea	127
	5.3. Quantisation of the kink solution	137

5.4. The kink mass and its renormalisation 144
5.5. The translation mode 150
5.6. Stability of the kink and its form factor 153
5.7. Conclusions 165

6. Functional integrals and the WKB method 167
6.1. The path-integral formalism 167
6.2. Generalisation to field theory 176
6.3. The Bohr–Sommerfeld condition 183
6.4. The WKB method in field theory 187
6.5. Concluding remarks on the WKB method 195

7. Some exact results 199
7.1. The bound-state spectrum of the sine–Gordon theory 199
7.2. Interpretation of the doublet states 208
7.3. Equivalence of the SG and MT models; bosonisation 213
7.4. Factorisation of S-matrices 219
7.5. Some exact S-matrices 225

8. Collective coordinates and canonical methods 237
8.1. Treatment of zero-modes: A miniature example 237
8.2. An example of an explicit collective coordinate 244
8.3. Implicit collective coordinates (classical) 252
8.4. Soliton quantisation by canonical operator methods 257

9. Semiclassical methods for Fermi fields 264
9.1. Introduction: Grassmann fields 264
9.2. Functional integral for the free Dirac field 273
9.3. Solitons in the presence of Fermi fields 277
9.4. The possibility of solitons of charge $\frac{1}{2}$ 291
9.5. Further comments 298

10. Instantons in quantum theory 303
10.1. Instantons and the periodic potential 303
10.2. Topological vacua in the abelian Higgs model 318
10.3. Vacuum tunnelling in the abelian Higgs model 325
10.4. The Yang–Mills vacuum 337
10.5. The infrared problem of large instantons 344

11. Some more instanton effects 351
11.1. Instantons and confinement 351
11.2. The relevance of massless fermions to QCD 358
11.3. Suppression of vacuum tunnelling by massless fermions 361
11.4. Instantons and Borel summability 373
11.5. Further developments 380

Appendix A 385

Appendix B 390
