Preface	vii
<b>0 CLASSICAL PHYSICS—A RESUMÉ</b>	<b>1</b>
1. Classical dynamics	2
(1) Basic concepts: space, time and mass	2
(2) Dynamical laws: simultaneous space-time <i>and</i> momentum-energy knowledge	4
(3) Canonical equations and transformation theory of dynamics	5
(4) Hamilton-Jacobi equation	10
2. Electromagnetic theory	19
(1) Electromagnetic fields	19
(2) Symmetry properties in space reflection and time reversal	23
3. Statistics and probability	25
Appendix 0: Hamilton's principle and canonical equations	26
<b>1 PRE-QUANTUM MECHANICAL PERIOD (1900–1925)</b>	<b>30</b>
1. Planck's quantum theory (1900)	31
2. Einstein's theory of the photon (1905) and the wave-particle duality	37
3. Quantum theory applied to vibrations of atoms (1906–7)	44
4. Bohr's theory—the concept of stationary states (1913)	46
5. Bohr's theory—refinements (1915)	49
6. Einstein's transition probabilities (1916)	52
7. The correspondence principle (1918)	55
8. Theory of dispersion—Ladenburg, Kramers and Heisenberg (1921–5)	59
9. Atomic spectra—empirics (up to 1925)	64
(1) Empirics: spectral terms, series, multiplets	65
(2) Anomalous Zeeman effect: Paschen-Back effect	70
10. Electron spin (1925)	73

(1) Spin-orbit interaction	73
(2) Remarks	74
(3) Stern-Gerlach's experiment	76
(4) Landé's $g$ -formula for anomalous Zeeman effect	76
(5) Paschen-Bach effect for strong magnetic fields	77
(6) Quantum numbers $L, S, J$	77
11. Pauli's exclusion principle (1925)	79
12. The birth of quantum mechanics	82
<b>2 MATRIX MECHANICS</b>	<b>85</b>
1. Heisenberg's initial ideas (1925)	85
2. Matrix algebra	88
Exercises	104
3. Transformation of representations: the theory of Dirac	106
Exercises	108
4. Matrix mechanics—principles	110
(1) Harmonic oscillator	114
Exercises	116
5. Angular momenta and selection rules	118
Exercises	122
6. Perturbation theory	123
(1) Non-degenerate systems	123
(2) Degenerate systems	126
7. Dirac's theory	126
<b>3 WAVE MECHANICS: EARLY DEVELOPMENTS</b>	<b>131</b>
1. de Broglie's ideas (1923–1924)	131
2. Schrödinger's wave mechanics (1926)	135
(1) Digression to Hamilton-Jacobi theory	136
(2) Digression to the relation between wave and ray optics	138
(3) Schrödinger equation	140
3. The Schrödinger theory	142
(1) Generalization to a system of $N$ particles	142
(2) Linearity and superposition principle	142
(3) Wave packet	143
(4) Time independence of $\int \Psi^* \Psi dq$	144
(5) Commutation relation and equivalence between matrix and wave mechanics	144
(6) Fourier transformation and representation transformation	146
(7) Conditions on $\psi$	148
(8) Relativistic wave equation	148

4. The eigenvalue problem	149
(1) The Sturm-Liouville problem	150
(2) Simple harmonic oscillator	154
(3) Central field problem, parity	157
(4) Angular momenta	160
Appendix A. Hermite polynomials	161
Appendix B. Harmonic oscillation in Fock representation	164
Appendix C. Associated Legendre polynomials	167
Appendix D. Angular momentum operators and spherical harmonics	172
Exercises	175
5. The hydrogen atom	178
(1) Discrete states, $E < 0$	179
(2) Continuum states, $E > 0$	181
(3) Normalization of continuum wave functions	183
Appendix E. Associated Laguerre polynomials	185
Exercises	189
<b>4 PROBABILITY POSTULATE AND UNCERTAINTY PRINCIPLE</b>	<b>191</b>
Introduction	191
1. Schrödinger equation in integral form	193
(1) Particle in a central field $V(r)$	193
(2) Scattering of a particle in a potential field	194
2. Probability interpretation	198
3. Uncertainty principle	199
Exercises	206
<b>5 QUANTUM MECHANICS: GENERAL THEORY</b>	<b>209</b>
1. Complementarity principle	209
2. Quantum mechanics: mathematical preliminaries	212
(1) Vector space, vectors	213
(2) Linear operators, hermitian operators	216
(3) Transformation of representations, unitary operators	219
(4) Non-commutative hermitian operators	220
(5) Unitary transformations	225
(6) Displacement operator	227
(7) Time translation operator $U(t)$	230
Exercises	231
3. Quantum mechanics in postulational form	232
Postulate I	232
Postulate II	232

Postulate III	233
Postulate IV	233
Postulate V	235
Postulate VI	239
4. Representation and measurement	239
(1) Representation	239
(2) Measurement	241
5. Relation between Heisenberg's and Schrödinger's equations of motion	242
6. Density matrix	245
(1) Pure and mixed state	246
(2) Density operator and density matrix	247
(3) Trace	248
(4) Normalization	248
(5) $\rho^2$ and the condition for a pure state	248
(6) Physical meaning of density matrix and mixed state	249
(7) Transformation property of $\rho$	251
(8) Liouville equation in quantum mechanics	252
(9) Density matrix and irreversibility of macroscopic processes	254
7. The Copenhagen school and Einstein's philosophy	254
<b>6 PERTURBATION THEORY: STATIONARY STATE PROBLEM</b>	<b>259</b>
1. Perturbation theory for non-degenerate systems	260
(1) Anharmonic oscillator	261
(2) Stark effect in alkali metals atoms	261
(3) Sommerfeld's relativistic correction	262
2. Perturbation theory for degenerate systems	265
(1) Stark effect in (non-relativistic) hydrogen atoms	267
Appendix F. Parabolic coordinates: Stark effect	269
Exercises	271
<b>7 TIME-DEPENDENT SYSTEMS</b>	<b>274</b>
1. Theory of the Raman effect and inverse Stark effect	274
2. Perturbation theory of transitions of Dirac	279
(1) Method of variation of constants	279
(2) Einstein's $B_{ij}^m, A_{ij}^m$ coefficients	283
(3) Theory of dispersion	286
(4) Rearrangement collisions	289
(5) Transition probability and cross section	291

3. Unitary (time-translation) operator	293
4. Method of integral equation and Green's function	296
(1) The unperturbed system $H_0$	297
(2) The perturbed system $H = H_0 + V$	299
5. Green's function as propagator	300
6. Uncertainty relation for energy and time	304
<b>8 THE HYDROGEN ATOM</b>	<b>307</b>
1. Electron spin	307
(1) Operators and eigenvectors	307
(2) Spin-orbit interactions	309
(3) Transformation between $(m_l, m_s)$ - and $(j, m)$ -representations	313
2. Selection rules	314
3. Fine structure	317
4. Zeeman effect	321
(1) Strong magnetic field, Paschen-Bach effect	322
(2) Weak magnetic field	323
(3) Arbitrary magnetic field	323
(4) Non-crossing theorem	324
5. Scattering of an electron by the hydrogen atom	325
(1) Born approximation	325
Exercises	327
<b>9 TWO- AND MANY-ELECTRON ATOMS</b>	<b>329</b>
1. Symmetry property	329
2. Two-electron atom: energy	332
(1) Perturbation theory	333
(2) Ritz variational method	337
(3) Hartree-Fock method	339
(4) Hylleraas' method	341
3. Two-electron atom: configuration and $\{L, S\}$ -coupling $^{2S+1}L$	344
(1) $L, S$ states, $e^2/r_{12}$ energies	344
(2) Spin-orbit interactions: multiplet structure	350
4. Two-electron atom: $\{j, j\}$ -coupling	353
5. Two-electron atom: intermediate coupling	357
6. Configuration interactions	359
(1) Autoionization	360
(2) Auger effect	364
7. Many-electron atoms	364
(1) Slater's method ( $\{L, S\}$ -coupling)	365

(2) Hartree-Fock method	370
(3) Selection rules for many-electron atoms	372
(4) Configuration interactions	373
8. The Thomas-Fermi potential and many-electron atoms	376
(1) The statistical potential	376
(2) Energy of an electron in an atom or ion	378
(3) WKB method of solving Eq. (IX-218)	380
(4) $f$ states in the actinium series of atoms	382
(5) The Rydberg correction to the $f$ states of a heavy atom	383
<b>10 QUANTUM MECHANICS OF MOLECULES</b>	<b>386</b>
1. Introduction	386
2. The electronic, vibrational and rotational motion of a molecule	388
(1) $H_2^+$ electronic states with fixed nuclei	390
(2) Nuclear vibration	391
(3) Rotational motion	392
3. The hydrogen molecule—the theory of Heitler and London	393
4. Coupling between vibrational and rotational motions	397
5. Vibrational motion of a polyatomic molecule	401
6. Rotational motion of a symmetrical top molecule	405
7. Nuclear spin in molecules	407
<b>NAME INDEX</b>	<b>411</b>
<b>SUBJECT INDEX</b>	<b>414</b>
