C. M. WILL – The theoretical tools of experimental gravitation.

1.	Theoretical frameworks for testing relativistic gravity	pag.	1
2.	The Dicke framework	»	4
2'1.	Statement of the framework	»	4
2'2.	The fields associated with gravity	»	5
3.	Significance of the Eötvös-Dicke-Braginsky experiment.	»	8
3'1.	Introduction	»	8
3'2.	Completeness, self-consistency and agreement with special-relativistic physics	»	9
3'3.	Schiff's conjecture	»	9
3'4.	Proofs of Schiff's conjecture.	»	11
3'5.	Significance of the gravitational red-shift experiment.	»	12
3'6.	Gravitation as a geometric phenomenon	»	14
4.	The parametrized Post-Newtonian formalism	»	18
4'1.	Introduction	»	18
4'2.	The post-Newtonian limit.	»	19
4'3.	The most general post-Newtonian metric.	»	22
4'4.	Co-ordinate-system freedom and the standard post-Newtonian gauge.	»	24
4'5.	The parametrized post-Newtonian metric.	»	25
4'6.	Lorentz invariance and the PPN metric	»	27
4'7.	Conservation laws in the PPN formalism.	»	31
5.	Metric theories of gravity and their post-Newtonian limit	»	42
5'1.	Introduction	»	42
5'2.	General relativity	»	42
5'3.	Scalar-tensor theories	»	46

5'4. Vector-metric theories	pag. 50
5'5. Tensor-metric theories	» 52
5'6. Conformally flat theories	» 53
5'7. Stratified theories with time-orthogonal conformally flat space slices	» 54
5'8. Whitehead's theory	» 58
6. Equations of motion in the PPN formalism	» 60
6'1. Introduction	» 60
6'2. Equations of motion for photons in the PPN formalism	» 61
6'3. Equations of motion for massive bodies in the PPN formalism	» 63
6'4. Equations of motion for spinning bodies in the PPN formalism	» 71
6'5. Cavendish experiments and the locally measured Newtonian gravitational constant	» 73
7. Observable effects and experimental tests of metric theories of gravity	» 79
7'1. Introduction	» 79
7'2. Light bending and time delay: measuring curvature in the solar system	» 79
7'3. Perihelion shifts	» 84
7'4. Geophysical « preferred frame » effects	» 88
7'5. Experimental disproof of Whitehead's theory	» 96
7'6. Precession of an orbiting gyroscope	» 97
7'7. The Nordtvedt effect	» 99
7'8. Other perturbations on the Earth-Moon system	» 104
7'9. White-dwarf pulsation and preferred-frame parameters	» 104
7'10. Secular variation in the Newtonian gravitational constant	» 104
7'11. Currently viable metric theories (as of June 1972)	» 105

R. F. C. VESSOT — Lectures on frequency stability and clocks and on the gravitational red-shift experiment.

1. Introduction to the lectures	» 111
2. Introduction to frequency stability	» 112
2'1. Definitions of frequency stability and the relationship between time-domain data and spectral densities of phase or frequency fluctuations	» 114
2'2. Models of spectral densities and their effects on time-domain variance	» 118
2'2.1. $S_y(f) = h_{-2}/f^2$	» 119
2'2.2. $S_y(f) = h_{-1}/f$	» 119
2'2.3. $S_y(f) = h_0$	» 119
2'2.4. $S_y(f) = h_1 f $ or $S_x(f) = (h_1/(2\pi)^2)f^{-1}$	» 120
2'2.5. $S_y(f) = h_2f^2$ or $S_x(f) = h_2/(2\pi)^2$	» 121
2'3. Tables of bias functions	» 121
2'4. Summary	» 122

3.	Frequency and time standards using quartz crystals and cesium, rubidium and hydrogen atoms	pag. 122
3'1.	Quartz-crystal resonators	» 123
3'2.	Cesium, rubidium and hydrogen atomic structure . . .	» 124
3'3.	The rubidium-gas-cell resonator	» 127
3'4.	The cesium-beam resonator	» 129
3'5.	Passive atomic frequency-control systems	» 131
3'6.	The atomic hydrogen maser.	» 133
4.	The present state of the art.	» 137
5.	The gravitational red-shift rocket probe experiment	» 138
5'1.	Objective	» 138
5'2.	Experiment description	» 139
5'3.	Hydrogen-maser clocks	» 146
5'4.	Probe maser oscillator	» 147
5'4.1.	Hydrogen pumping.	» 147
5'4.2.	Cavity	» 149
5'4.3.	Magnetic shields	» 150
5'4.4.	Solenoid.	» 152
5'4.5.	Hydrogen-gas-handling system	» 152
5'5.	Red-shift data acquisition system	» 152
5'6.	Data acquisition plan	» 158
5'6.1.	Accuracy requirements for tracking and other experimental parameters	» 160
5'6.2.	Overall error budget	» 161

J. D. ANDERSON – Lectures on physical and technical problems posed
by precision radio tracking.

1.	Introduction	» 163
1'1.	Spacecraft data	» 163
1'2.	Determination of astronomical constants and relativistic parameters	» 167
1'3.	Required computational precision	» 169
1'4.	Computation of spacecraft range and Doppler	» 170
2.	Orbital equations	» 173
2'1.	Equations of motion	» 174
2'2.	Heliocentric equations of motion	» 175
2'3.	Perturbative forces	» 176
2'3.1.	Solar oblateness	» 177
2'3.2.	Solar-radiation pressure.	» 177
2'3.3.	Solar wind	» 178
2'3.4.	On-board forces	» 178
2'4.	Random accelerations	» 179

3.	Station locations, timing and propagation effects	pag. 181
3'1.	Co-ordinate to proper time	» 181
3'2.	Station location	» 183
3'3.	Propagation effects	» 185
3'3.1.	Troposphere corrections.	» 186
3'3.2.	Ionosphere and interplanetary medium.	» 187
4.	Estimation theory	» 188
4'1.	Weighted least-squares method	» 189
4'1.	Sequential estimation	» 191
4'3.	The Kalman filter	» 192
4'4.	Nonadaptive sequential filter	» 193
4'5.	Adaptive sequential filter	» 196

R. H. DICKE – Relativity and the solar oblateness.

1.	Introduction	» 200
2.	The observations	» 204
2'1.	The solar oblateness and the quadrupole moment.	» 204
2'2.	The oblateness telescope	» 208
2'3.	Observational technique	» 214
2'4.	Fluctuations in the solar oblateness	» 219
2'5.	Solar oblateness <i>vs.</i> equatorial brightening	» 221
3.	The oblateness and solar physics.	» 222
3'1.	» 222
3'2.	Stellar winds and rotating stars	» 224
3'3.	Circulation currents	» 225
3'4.	Thermally driven turbulence	» 228
3'5.	The depletion of lithium and beryllium	» 229
4.	Summary and conclusions	» 231

V. B. BRAGINSKY – The detection of small accelerations, gravitational antennae, verification of the principle of equivalence.

Introduction		» 235
PART I		» 235
1.	The detection of small forces acting on the macroscopic oscillator	» 235
1'1.	Classical case	» 235
1'2.	Backward dynamic influence of the registering device on the mechanical oscillator	» 238
1'3.	Backward fluctuation on influence of the transducer. The optimal strategy of measurements	» 240

2.	Gravitational antennae	pag.	243
2'1.	Gravitational antenna of Weber type	»	243
2'2.	Nonresonant gravitational antennae	»	246
2'3.	Heterodyne detector of gravitational radiation	»	247
2'4.	Gravitational electromagnetic resonance	»	249
PART II		»	252
1.	Verification of the equivalence of inertial and gravitational mass	»	252
1'1.	Measurement technique	»	252
1'2.	Measurements and simulative effects	»	256
1'3.	Discussion of results	»	258
2.	Search for gravitational radiation of cosmic origin	»	259
2'1.	»	259
2'2.	Results of 20 day's coincident recording	»	261
J. WEBER – Gravitational radiation experiments and instrumentation.			
PART I – Gravitational-radiation experiments		»	263
1.	Introduction	»	263
2.	Gravitational-radiation detectors	»	264
3.	Classification scheme for the coincidences	»	264
4.	Early experiments	»	265
5.	Magnetic-tape computer experiment	»	266
6.	Seismic, electromagnetic and cosmic-ray interactions	»	269
7.	Conclusions	»	270
PART II – Theory of the gravitational radiation detector with ferroelectric crystal coupling		»	271
PART III – Noise and sensitivity of a gravitational-radiation detector with ferroelectric coupling		»	275
1.	Introduction	»	275
2.	Optimum bandwidth calculation	»	276
3.	Detectable energy flux spectral density	»	277
4.	Conclusion	»	278
W. M. FAIRBANK – The use of low-temperature technology in gravitational experiments.			
1.	Introduction	»	280
2.	Macroscopic quantum phenomena	»	280
3.	Other useful low-temperature properties	»	291

W. M. FAIRBANK, S. P. BOUGHN, H. J. PAIK, M. S. MCASHAN, J. E. OPFER, R. C. TABER, W. O. HAMILTON, B. PIPES, T. BERNAT and J. M. REYNOLDS – Search for gravitational radiation using low-temperature techniques.	
1. Introduction	pag. 294
2. Theory of gravitational-radiation detector.	» 295
3. Experimental program	» 298
3'1. Aluminium-bar antenna and cryogenic system	» 299
3'2. Superconducting resonant diaphragm transducer	» 304
3'3. Superconducting magnetometer	» 306
3'4. Magnetic and superconducting shield.	» 306
4. Conclusion	» 308
W. M. FAIRBANK, F. C. WITTEBORN, J. M. J. MADEY and J. M. LOCKHART – Experiments to determine the force of gravity on single electrons and positrons	» 310
C. W. F. EVERITT – The gyroscope experiment. - I: General description and analysis of gyroscope performance.	
1. Introduction	» 331
2. Description of the experiment	» 334
3. Analysis of gyro errors	» 344
3'1. Size and choice of material for an ideal gyro-rotor . .	» 345
3'2. Homogeneity of the rotor and the problem of an Earth- bound experiment	» 346
3'3. Torques due to the suspension system and residual electric charge, and their effects on sphericity and centering accuracy	» 347
3'4. Optimum spin speed	» 353
3'5. Magnitude of residual accelerations on the gyroscope	» 353
3'6. Magnetic torques and readout limitations	» 354
3'7. Gas torques and the spin-up problem	» 355
3'8. Ultimate limits	» 357
4. Summary and conclusion	» 358
J. A. LIPA, W. M. FAIRBANK and C. W. F. EVERITT – The gyroscope experiment. - II: Development of the London- moment gyroscope and of cryogenic technology for space.	
1. Background	» 361
2. Design and construction of the gyroscope.	» 362

3.	The cryogenic system	pag. 369
3'1.	The porous-plug method for controlling liquids in space »	369
3'2.	100 l experimental Dewar	» 373
4.	Laboratory test set-up and flight program	» 378
P. W. WORDEN jr. and C. W. F. EVERITT - The gyroscope experiment. - III: Tests of the equivalence of gravitational and inertial mass based on cryogenic techniques.		
1.	Introduction	» 381
2.	Design of experiment	» 383
2'1.	Support and control of the test masses	» 383
2'2.	Position readout	» 386
3.	Limitations to the accuracy of the experiment	» 391
3'1.	Thermal noise	» 391
3'2.	Gravity gradient effects.	» 394
3'3.	Other disturbing forces	» 399
4.	Summary of present status and conclusion	» 401
SEMINARI » 403		
R. W. DAVIES - A suggested space mission for measuring the angular momentum of the sun.		
Introduction » 405		
1.	Experimental concept	» 405
Appendix I » 408		
Appendix II » 412		
L. HALPERN - On the detection of gravitational radiation by its interaction with electromagnetic fields.		
1.	Introduction	» 414
1'1.	» 414
1'2.	» 415
2.	Discussion of the different types of experiments.	» 416
3.	Discussion of the results	» 421

G. ISRAEL, R. PACAULT, E. ROTH, J. SCHNIEWIND, I. F. CROCE-SPINELLI and S. LARCHER – Testing gravitation theories by means of a heliocentric probe.

1. Introduction	pag. 425
2. Objectives of the SOREL mission	» 426
3. Description of the mission	» 429
3'1. The measurement function	» 429
3'2. The reference orbit	» 429
3'3. The spacecraft	» 431
4. Error analysis	» 436
4'1. The mathematical model	» 436
4'2. Analysis of error sources	» 438
4'3. Modelling of error sources	» 441
4'4. Results	» 442
Appendix - Error processing method	» 445

R. JUILLERAT – Analyse des limitations physiques des accéléromètres pour sonde spatiale et des détecteurs de sonde à traînée compensée « drag-free probe ».

1. Introduction	» 449
2. Sonde spatiale accélérométrique et sonde spatiale à traînée compensée	» 450
2'1. Relations générales	» 450
2'2. Accéléromètre	» 452
2'3. Sonde à traînée compensée	» 454
3. Existence de limitations physiques	» 455
3'1. Classement par effets	» 456
3'2. Classement par origine	» 457
4. Analyse des forces perturbatrices	» 457
4'1. Forces gravitationnelles propres à la sonde spatiale	» 457
4'1.1. Evaluation du terme constant γ_0 (accélération du Type I)	» 458
4'1.2. Evaluation des termes gradients (accélération du Type II)	» 460
4'1.3. Evaluation de la perturbation gravitationnelle due à la dilatation thermique de la sonde (accélération de Type III)	» 461
4'1.4. Conclusion sur les perturbations gravitationnelles	» 462

4'2.	Forces électrostatiques	pag. 463
4'2.1.	Origine des forces électrostatiques	» 463
4'2.2.	Electrisation par contact entre deux corps conducteurs	» 464
4'2.3.	Electrisation par particules cosmiques	» 466
4'2.3.1.	Flux de particules	» 466
4'2.3.2.	Interaction avec la matière	» 466
4'2.3.3.	Evaluation du courant de charges	» 467
4'2.3.4.	Conclusion	» 468
4'2.4.	Expression de la force électrostatique principale	» 468
4'2.5.	Régulation de la charge électrique.	» 471
4'2.5.1.	Régulation du potentiel.	» 471
4'2.5.2.	Régulation en charge et conclusion	» 472
4'2.6.	Evaluation des accélérations perturbatrices	» 473
4'2.6.1.	Exemple 1.	» 473
4'2.6.2.	Exemple 2.	» 473
4'2.6.3.	Exemple 3.	» 474
4'3.	Force magnétostatique	» 474
4'4.	Forces d'origine thermique	» 475
4'4.1.	Comparison des effets moléculaires et radiatifs	» 476
4'4.2.	Accélération perturbatrice d'origine thermomoléculaire	» 478
4'5.	Force de liaison due au détecteur de position	» 479
4'6.	Autres forces perturbatrices	» 480
5.	Seuils d'accélération des accélémètres et des détecteurs de sonde à traînée compensée	» 480
5'1.	Accélémètre	» 481
5'2.	Détecteur de sonde à traînée compensée	» 482
6.	Exemples de réalisations ou de projets	» 484
6'1.	Accélémètre CACTUS de l'ONERA (Exemple 1)	» 484
6'2.	Project SERTOG de ERNO (Exemple 2)	» 487
6'3.	Etude ONERA de détecteur de sonde héliocentrique à traînée compensée (Exemple 3)	» 487

B. BERTOTTI - Generation of geodesic motion by the twin probe method.

1.	Introduction	» 490
2.	The basic-experimental set up	» 491
3.	Accuracy of the experiment	» 492
4.	Satellite design	» 493
5.	Conclusion	» 494

R. F. O'CONNELL – Spin, rotation and C , P and T effects in the gravitational interaction and related experiments.

1. Introduction	pag. 496
2. General formulation	» 479
3. Experimental tests of spin and rotation effects.	» 501
4. Precession of a gyroscope	» 503
5. Differential acceleration of a gyroscope	» 506
6. Spin effects in black-hole physics	» 509
7. Possible C , P and T violating terms in the gravitational interaction	» 511

H. PAIK – Low-temperature gravitational wave detector.

1. Introduction	» 515
2. Thermal fluctuations in the antenna	» 515
3. Resonant diaphragm	» 517
4. Superconducting inductive transducer.	» 519
5. Low-noise parametric amplifier.	» 520
6. Sensitivity of cryogenic gravitational wave detector	» 521
7. Output analysis.	» 523

I. W. ROXBURGH – Solar oblateness and the solar quadrupole moment.

1. Introduction	» 525
2. The solar photosphere and the solar oblateness	» 525

R. SRAMEK – The gravitational deflection of radio waves.

1. Introduction	» 529
2. Measuring radio source positions	» 530
3. The relativity experiment	» 535
4. The error analysis	» 541

V. S. TUMAN - In search of low-frequency gravitational radiation using cross-correlation of Earth-Moon vibrations.

Introduction and summary	pag. 543
PART I - A brief description of the cryogenic gravity meter »	545
1. Suspension unit	» 546
2. Accessories to the suspension unit.	» 548
2'1. Levitation module.	» 548
2'2. Power supplies for the magnetic suspension system	» 548
3. Detection unit.	» 548
3'1. Magnetometer detection system. The detection module	» 548
3'2. Phase-sensitive detector and feed-back system. . .	» 549
3'3. Power supply and oscilloscope monitor for the detection module	» 549
4. Output unit	» 550
4'1. Chart recorder	» 550
4'2. Digital data acquisition system.	» 550
5. Calibration unit	» 550
6. Preliminary calibration of the instrument	» 551
7. Determination of α , the ratio of the flux at the pick-up coil to the output voltage	» 552
8. Determination of the spring constant K of the instrument	» 552
9. Magnetic flux change at the pick-up coil due to motion of the ball.	» 554
PART II - Planetary eigenvibrations and some of the terrestrial results	» 558
1. The Earth's eigenvibrations.	» 558
2. Observations of the Earth's eigenvibrations	» 562
3. Energy estimation	» 565
PART III - Proposed experimental plan	» 568
1. Cross correlation of Earth-Moon eigenvibrations	» 568
2. Concluding remarks	» 571
B. BERTOTTI - Concluding remarks	» 573
