R. K. SACHS – Introduction pag. XII

Gruppo fotografico dei partecipanti al Corso fuori testo

J. EHLERS – General relativity and kinetic theory.

1. Introduction	pag.	1
2. Summary of Einstein's theory of gravitation and its mathematical apparatus.	»	2
2'1.	»	2
2'2.	»	3
2'3.	»	4
2'4.	»	5
2'5.	»	7
2'6.	»	7
2'7.	»	9
2'8.	»	9
2'9.	»	10
2'10.	»	11
2'11.	»	12
2'12.	»	14
2'13.	»	14
2'14.	»	16
3. Differential forms and integration on manifolds	»	16
3'1.	»	17
3'2.	»	20
3'3.	»	21
3'4.	»	23
3'5.	»	24
3'6.	»	25
3'7.	»	26

4. Kinetic theory	pag.	27
4'1.	»	27
4'2.	»	28
4'3.	»	30
4'4.	»	34
4'5.	»	35
4'6.	»	38
4'7.	»	40
4'8.	»	41
4'9.	»	42
4'10.	»	45
4'11.	»	47
4'12.	»	49
4'13.	»	51
4'14.	»	52
4'15.	»	53
4'16.	»	54
4'17.	»	57
4'18.	»	60
4'19.	»	63
4'20.	»	64
APPENDIX I - Example of a 4-manifold which is not time-orientable	»	67
APPENDIX II - Geometrical construction of the mass-shell volume element π_m	»	67
R. GEROCH - Space-time structure from a global viewpoint.		
Introduction.	»	71
1. Topology and manifolds	»	72
2. Direction fields, orientation	»	79
3. Casual structure I. The domain of influence	»	84
4. Causal structure II. The domain of dependence	»	91
5. Asymptotic properties	»	96
APPENDIX - Hausdorff, connected and paracompact manifolds	»	99
G. F. R. ELLIS - Relativistic cosmology.		
1. Introduction	»	104
2. Kinematical quantities.	»	106
2'1. The velocity vector field	»	106
2'1.1. The projection tensor.	»	107
2'1.2. Volume elements.	»	108

2'2.	Time derivatives	pag. 108
2'3.	The acceleration vector	» 109
2'4.	Relative motion of neighbouring particles	» 109
2'4.1.	The relative position vector	» 109
2'4.2.	Relative velocity	» 110
2'5.	The kinematic quantities	» 112
2'5.1.	Volume expansion	» 113
2'5.2.	Shear	» 113
2'5.3.	Vorticity	» 113
2'5.4.	General motion	» 114
2'5.5.	Kinematic quantities in the universe	» 114
2'5.6.	Other applications	» 114
3.	Conservation of energy and momentum	» 115
3'1.	The average velocity	» 115
3'2.	Conservation of energy and momentum	» 116
3'3.	Equations of state	» 117
3'3.1.	General restrictions	» 117
3'3.2.	Phenomenological equations	» 117
3'4.	Perfect fluids	» 119
3'5.	The matter and radiation content of the universe	» 120
3'5.1.	Matter content	» 120
3'5.2.	Radiation content	» 121
3'6.	The thermal history of the universe	» 122
4.	The field equations	» 124
4'1.	The curvature tensor	» 124
4'1.1.	The role of the field equations	» 125
4'2.	The Ricci identities for the velocity vector	» 126
4'2.1.	Raychaudhuri's equation	» 127
4'2.2.	Further propagation equations	» 129
4'2.3.	Constraint equations	» 129
4'3.	The Bianchi identities	» 131
4'4.	The field equations	» 132
4'4.1.	The case of zero rotation	» 132
4'4.2.	The field equations in general	» 133
4'4.3.	Comparison of Newtonian and general-relativity equations	» 134
5.	Applications of the field equations	» 135
5'1.	The Friedmann (or Robertson-Walker) models	» 135
5'1.1.	Expansion from a singularity	» 137
5'1.2.	Qualitative properties of the solutions	» 138
5'1.3.	Co-ordinates	» 140
5'2.	Gödel's solution	» 140

5'3.	Further solutions	pag. 141
5'3.1.	Solution with $\sigma = \dot{u} = 0$, $\omega\theta \neq 0$	» 142
5'3.2.	Solutions with $\omega = \dot{u} = 0$, $\sigma\theta \neq 0$, $K(x, e^a)$ isotropic	» 142
5'3.3.	Perturbations	» 143
5'3.4.	Viscous effects	» 143
5'3.5.	Further solutions	» 143
6.	Observations in cosmological models	» 144
6'1.	The geometric optics approximation	» 144
6'2.	Red-shifts	» 146
6'2.1.	The linear red-shift relation in a cosmological model	» 147
6'2.2.	Spherically symmetric cosmological models	» 148
6'3.	Polarization	» 149
6'4.	Luminosity	» 149
6'4.1.	The area law	» 149
6'4.2.	Relation to the source luminosity	» 151
6'4.3.	Distance definitions	» 152
6'4.4.	Spherically symmetric cosmological models	» 157
6'5.	Number counts in a cosmological model	» 159
6'5.1.	Spherically symmetric models	» 160
6'6.	Observed specific intensity	» 161
6'6.1.	Specific flux	» 161
6'6.2.	Intensity	» 161
6'6.3.	Specific intensity	» 162
6'6.4.	Absorption and emission in a cosmological model	» 164
6'6.5.	Spherically symmetric models	» 166
6'7.	Null cone observations in a cosmological model	» 169
7.	The observable universe	» 171
7'1.	Causality	» 171
7'2.	Isotropy of the microwave radiation	» 172
7'3.	The existence of singularities	» 172
7'4.	The early universe	» 175
7'5.	The nature of the singularity	» 176
7'6.	The observable universe	» 176
APPENDIX.	» 179

D. W. SCIAMA – Astrophysical cosmology.

1.	The classical period	» 183
2.	Robertson-Walker models	» 184
3.	The semi-classical period	» 187
4.	The modern period	» 189
5.	The intergalactic medium	» 189

6. The microwave background radiation	pag. 193
7. The molecular measurements	» 195
8. The thermal history of the universe	» 200
9. Isotropy of the background	» 204
10. Relation to Mach's principle	» 215
11. The helium problem.	» 218
12. High-energy interactions with the black-body radiation . .	» 225
12'1. Cosmic-ray protons	» 226
12'2. Cosmic γ -rays	» 227
12'3. Relativistic electrons	» 228

K. S. THORNE – Relativistic stars, black holes and gravitational waves (including an in-depth review of the theory of rotating, relativistic stars).

1. Overview.	» 237
1'1. The relevance of general relativity to Astronomy . . .	» 237
1'2. The nature of these lectures	» 238
2. Nonrotating, relativistic stellar models	» 239
3. Rotation of relativistic stellar models.	» 240
3'1. General properties of rotating, relativistic stellar models	» 240
3'1.1. Co-ordinate systems	» 240
APPENDIX TO SUBSECTION 3'1.1. – Proof that for the space-time manifold of an axially symmetric, rotating star there exist co-ordinates with the properties i) to v)	» 242
3'1.2. Differential rotation and rigid rotation	» 244
3'1.3. Injection energy	» 245
3'1.4. Convection in a rigidly rotating star.	» 247
3'1.5. Von Zeipel's theorem in general relativity . . .	» 248
3'1.6. Redshift of light from the surface of a rotating star.	» 250
3'1.7. Dragging of inertial frames	» 251
APPENDIX TO SUBSECTION 3'1.7	» 256
3'1.8. Methods of constructing a relativistic, rotating stellar model	» 257
3'1.9. The external gravitational field	» 259
3'1.10. Angular momentum and rotational energy . . .	» 261
3'2. Rapidly rotating, nearly Newtonian stars.	» 262
3'2.1. The post-Newtonian formalism	» 262
3'2.2. MacLaurin spheroids, Jacobi ellipsoids, and Roche model.	» 262
3'2.3. The limit of slow rotation	» 264

3'3.	Slowly rotating, fully relativistic stars	pag. 264
3'3.1.	Relevance to pulsars	» 264
3'3.2.	Equations of structure	» 265
3'3.3.	The level surfaces	» 271
3'3.4.	External gravitational field	» 273
3'3.5.	Numerical models for the slowly rotating neutron stars of pulsar theory	» 275
3'3.6.	Pulsations of slowly rotating stars	» 278
3'3.7.	Mach's principle and slowly rotating configurations	» 279
3'4.	Rapidly rotating, fully relativistic disk	» 279
4.	Gravitational collapse and black holes	» 280
5.	Gravitational waves	» 281
G. R. BURBIDGE and E. M. BURBIDGE	– Quasi-stellar objects: Their importance for cosmology and general relativity	» 284
1.	The red-shift apparent magnitude relation	» 285
2.	The distribution of red-shifts.	» 286
3.	Attempts to measure the distances of the QSOs	» 293
4.	Absorption in the spectra of QSOs	» 294
5.	Space density of QSOs	» 299
6.	QSOs and the $\log N$ - $\log S$ relation	» 299
7.	QSOs and the microwave background radiation	» 301
8.	Strong gravitational fields in QSOs and galactic nuclei	» 302
E. M. BURBIDGE	– Optical observations relevant to cosmology: Hubble diagram.	
1.	Definitions and nature of problem	» 306
2.	Observational problems	» 309
3.	Sandage's results	» 313
4.	Additional problems with red-shifts.	» 313
M. J. REES	– Some current ideas on galaxy formation.	
1.	Introduction	» 315
2.	Gravitational instability of Friedmann models	» 316
3.	The fate of perturbations in the primordial fireball	» 321
4.	Processes occurring after t_{rec}	» 327
5.	Scope for further work	» 331
6.	Theory.	» 336
6'1.	» 337
6'2.	» 338

6'3.	pag.	338
6'4.	»	339
6'5.	»	340
7. Discussion	»	342
APPENDIX - The Lemaitre model	»	344
B. BERTOTTI - Detection of gravitational waves.	»	347
1.	»	347
2.	»	347
3.	»	349
4.	»	349
5.	»	351
6.	»	352
7.	»	353
J. R. IPSER - The stability of relativistic star clusters.	»	356
H. HEINTZMANN - General relativistic neutron and hyperon star models.	»	359
G. BÖRNER - Elementary particles in De Sitter space.	»	362
W. KUNDT - Cosmological density fluctuations during hadron stage.		
1. Introduction	»	365
2. Hagedorn's theory	»	367
3. Application to cosmology	»	370
G. STEIGMAN - Antimatter and cosmology.		
1. Introduction	»	373
2. Gamma rays	»	374
3. Steady-state cosmology	»	377
4. Alfvén-Klein cosmology	»	378
5. Big-bang cosmology	»	379
6. Conclusion	»	380
H. URBANTKE - Creation of particles by gravitational fields.		
1. Mechanisms of creation	»	383
2. Particle creation by gravitation fields.	»	384
