Table of Contents

Editorial Preface ix

Foreword xi

Preface xv

Part A

Chapter 1 / Concepts 3

1.1. The Principle of Relativity 3
1.2. The Meaning of Motion in Relativity Theory 6
1.3. The Speed of Light in Relativity and Space-Time Fusion 8
1.4. Continuity Replaces Atomism 10
1.5. The Unified Field Concept 11
1.6. General Relativity and Geometry 14
1.7. A Generalized Mach Principle 17

Part B: Mathematical Preliminaries

Chapter 2 / Vector-Tensor Analysis in Relativity Theory 21

2.1. The Invariant Metric 21
2.2. Special Relativity Transformations – The Poincaré Group 22
2.3. The Contravariant Vector Field 25
2.4. The Covariant Vector Field 25
2.5. The Scalar Field 26
2.6. Correspondence between Contravariant and Covariant Vector Transformations in Special Relativity 26
2.7. Tensors 27
2.8. The Metric Tensor $g_{\mu\nu}(x)$ 27
2.9. The Inverse Metric Tensor Field 28

2.10. Conversion between Contravariant and Covariant Tensor Indices 29
2.11. Transformation Properties of the Volume Element in General Relativity 30
2.12. Calculus of Vector and Tensor Fields in a Riemannian Space-Time 31
2.13. General Properties of the Covariant Derivative 33
2.14. Derivation of the Affine Connection in Terms of $g_{\alpha\beta}$ 35
2.15. The Geodesic Equation 36

Chapter 3 / Spinor-Quaternion Analysis in Relativity Theory 40

3.1. Discovery of Spinor Variables in Physics 40
3.2. The Algebra of Complex Numbers 41
3.3. Group Properties of the Set of Complex Numbers 43
3.4. The Algebra of Quaternions 44
3.5. Group Properties of the Set of Quaternions 49
3.6. The Spinor Field and Special Relativity 49
3.7. Transformation Properties of a Spinor Variable 52
3.8. The Explicit Form of Spinor Representations of the Poincaré Group 53
3.9. The Three-Dimensional Rotation Group and Spinor Transformations 54
3.10. Lack of Reflection Symmetry in the Spinor Formulation 55
3.11. Spinors and Quaternions in a Riemannian Space-Time 57
3.12. Conjugation and Time Reversal of Spinor and Quaternion Fields 61
3.13. Quaternion Calculus 62
3.14. Spin-Affine Connection 64
3.15. Spinor Transformations in General Relativity 66

Part C: The Field Equations

Chapter 4 / The Matter Field Equations 73

4.1. On the Origin of the Inertia of Matter and Mach's Principle 73
4.2. The Matter Field Equations from Quaternion Calculus in Special Relativity 77
4.3. Relativistic Covariance 79
4.4. The Bispinor Form of Dirac Equation 80
4.5. The Inertial Mass Field from General Relativity 82
4.6. The Matter Field Equations in General Relativity 85
4.7. Gauge Invariance 86

4.8. Electromagnetic Coupling 90
4.9. The Null Electromagnetic Potential 91
4.10. Matter and Antimatter from General Relativity 92
4.11. The Quantum Mechanical Limit of the Matter Field Equations 92
4.12. Energy and Momentum Operators 95
4.13. On the Unification on Inertia, Gravitation, and Electromagnetism 96
4.14. The Mass Spectrum of Elementary Matter 97

Chapter 5 / The Electromagnetic Field Equations 99

5.1. Implications of the Generalized Mach Principle in Electromagnetic Theory 99
5.2. Vector-Tensor formulations of Maxwell's Equations in Special Relativity 103
5.3. Generalization of Maxwell's Equations in the Elementary Interaction Formalism 106
5.4. Conventional Forms of Maxwell's Equations in General Relativity 108
5.5. A Spinor Formulation of Electromagnetic theory in Special Relativity 110
5.6. Invariants and Conservation Laws 113
5.7. The Lagrangian for the Spinor Formulation of Electromagnetism 115
5.8. Solutions of the Spinor Field Equations 117
5.9. Spinor Field Solution for a Static Point Charge 119
5.10. Coulomb's Law 120
5.11. The Spinor Formulation of Electromagnetism in General Relativity 124
5.12. Global Extension of the Spinor Conservation Laws 124
5.13. The Electromagnetic Interaction Functional in the Matter Field Equations 128

Chapter 6 / The Gravitational Field Equations and Unification with Inertia and Electromagnetism 132

6.1. Physics, Geometry, and Algebra 132
6.2. Toward a Unified Field Theory 134
6.3. Einstein's Field Equations and the Mach Principle 137
6.4. The Riemann Curvature Tensor 139
6.5. The Ricci Tensor 140
6.6. The Einstein Field Equations 141
6.7. Planetary Motion and the Schwarzschild Problem 142
6.8. The Newtonian Limit 144

6.9. The Gravitational Red Shift 146
6.10. The Precession of the Perehelion of a Planetary Orbit 148
6.11. The Bending of Light 150
6.12. The Variables of a Riemannian Space-Time in Quaternion Form 151
6.13. Derivation of the Quaternion Metrical Field Equations from the Principle of Least Action 153
6.14. A Symmetric Tensor – Antisymmetric Tensor Representation of General Relativity 156
6.14.1. Einstein's Field Equations from the Symmetric Tensor Part 157
6.14.2. Maxwell's Field Equations from the Antisymmetric Tensor Part 159
6.15. On the Quantization of Electrical Charge in General Relativity 164
6.16. Mass Doublets from General Relativity 167
6.17. A Linear Approximation 168
6.18. The Electron-Muon Mass Doublet 170
6.19. Lifetime of the Muon 174

Chapter 7 / Astrophysics and Cosmology 177

7.1. Introduction 177
7.2. The Geodesic Equation in Quaternion Form 178
7.3. Planetary Motion from the Quaternion Form of General Relativity 182
7.4. Application to the Schwarzschild Problem 184
7.5. Comparisons of the Quaternion, Classical, and Tensor Predictions of Planetary Motion 185
7.6. The Radial Solutions and Perehelion Precession 187
7.7. Implications of the Hubble Law and the Expanding Universe 189
7.8. The Spiral Structures of Galaxies 193
7.9. Conclusions 197

Bibliography 201

Selections from the Author's Bibliography 202
