

CONTENTS

Preface	VII
-------------------	-----

CHAPTER I. THE SPACE-TIME CONTINUUM AND THE SEPARATION BETWEEN EVENTS

1. Concepts	1
2. Events and particles	5
3. Space-time	6
4. The assignment of space-time coordinates	7
5. Notation	8
6. World lines and space-time diagrams	9
7. The motion of a material particle	10
8. Past, present and future	11
9. Standard clocks	14
10. The separation between events.	15
11. The fundamental quadratic form	16
12. Finsler space-time and Hamiltonian methods	19
13. Space-time as a Riemannian space	22
14. Measurement of spacelike separation	24
15. The physical meaning of orthogonality	26
16. Distance between particles	29
17. Rigid rods	30
18. The world lines of free particles	32
19. The special and general theories of relativity	34
20. Rigid motions	36

CHAPTER II. INTRODUCTION TO THE SPECIAL THEORY

1. Basis of the special theory of relativity	38
2. Finite separations	39
3. How to draw a straight line in space-time	42
4. Pairs of straight lines in space-time, parallel and skew	44
5. The physical meaning of the special coordinates	47
6. Splitting space-time into space and time	49

7. Galileian frames of reference	52
8. Proper time and the speed of light	54
9. Minkowskian coordinates	56
CHAPTER III. SPACE-TIME DIAGRAM	
1. Some elements of the geometry of flat space-time . . .	59
2. Orthogonal projections	61
3. Space-time diagrams	63
4. Space-time diagram of the null cone	64
5. M -geometry and E -geometry	65
6. Pseudospheres	67
CHAPTER IV. THE LORENTZ TRANSFORMATION	
1. The general Lorentz transformation	69
2. Restrictions on Lorentz transformations	73
3. The two ways of interpreting transformations	75
4. Geometrical meaning of the Lorentz transformation .	76
5. Eulerian angles and pseudoangles	79
6. Lorentz transformations regarded as rigid body dis- placements	84
7. The Lorentz 4-screw	86
8. Reduction of any Lorentz transformation to a 4-screw	90
9. Correspondence between triads of null rays and unit orthogonal tetrads	94
10. Lorentz transformations represented by arbitrary transformations of triads of null rays	98
11. Spinors	103
12. The two spin transformations corresponding to a given Lorentz transformation	107
13. The simple Lorentz transformation between two frames of reference	110
14. Lorentz transformations with Hermitian (or sym- metric) matrix	114
CHAPTER V. APPLICATIONS OF THE LORENTZ TRANS- FORMATION	
1. Apparent contraction of a moving body and apparent retardation of a moving clock	118
2. Snapshots	120

3. Space-time diagrams of contraction and retardation . . .	122
4. Composition of velocities	126
5. The velocity 4-vector and the acceleration 4-vector . .	130
6. Transformation of a wave motion	133
7. Reflection at moving mirrors	138
8. Fresnel's convection coefficient	142
9. Aberration	146
10. The expanding universe in special relativity	150
11. The red-shift	152
12. Luminosity and distance	153
13. The dependence of red-shift on apparent distance and the age of the universe	156
14. The Michelson-Morley experiment	158

CHAPTER VI. MECHANICS OF A PARTICLE AND COLLISION PROBLEMS

1. Force. Action and reaction. A philosophical digression	163
2. Particles and mass	165
3. Equations of motion	166
4. Is proper mass constant?	167
5. Interpretation of the equations of motion	168
6. Motion under a constant relative force and in a constant magnetic field	171
7. Momentum 4-vector for a photon	172
8. Collision and disintegration problems	173
9. Space-time diagrams of collisions	176
10. The triangle inequality in space-time	177
11. Mass-centre reference system. Release of energy in disintegration	180
12. Some numerical values	182
13. Inelastic collision of two particles	183
14. Disintegration of one particle into two	185
15. Emission of a photon from an atom	187
16. The sameness of photons	189
17. The emission and absorption of a photon	191
18. The Compton effect	193
19. The annihilation and creation of matter	199
20. Elastic collisions	205

CHAPTER VII. MECHANICS OF A DISCRETE SYSTEM

1. Discrete and continuous systems	208
2. Impulses and continuous forces	209
3. Internal impulses	210
4. The conservation of 4-momentum for a system.	213
5. Angular momentum and its conservation	216
6. The mass-centre of a system	218
7. Intrinsic angular momentum of a particle	220
8. The geometrical representation of a skew-symmetric tensor	223
9. Elastic collisions with unchanged intrinsic angular momentum invariants. The case of identical material particles	227
10. Example of an elastic collision with intrinsic angular momentum invariants unchanged	235
11. General treatment of elastic collision with intrinsic angular momentum	237
12. Summary of procedure for solving a collision problem	246
13. Particular cases of collisions	248
14. External impulses and impulsive torques acting on a system	251
15. The two-body problem	254

CHAPTER VIII. MECHANICS OF A CONTINUUM

1. Density	261
2. Fundamental laws of relative momentum and relative energy for a system	263
3. Impact of a stream of particles on a target	265
4. Pressure in a relativistic gas	267
5. Pressure due to the impact of photons	269
6. World tubes and their cross-sections	272
7. Green's theorem and the expansion of world tubes	276
8. The energy tensor of a continuous medium	281
9. The physical meaning of the energy tensor	285
10. The energy tensor for an incoherent stream of material particles	288
11. Eigen values of the energy tensor	290
12. Mean density, mean velocity and stress	296
13. Equations of motion of a continuous medium	300

14. The perfect fluid in relativity	302
15. Incompressible fluids	306
16. Isolated systems and the energy tensor	309

CHAPTER IX. THE ELECTROMAGNETIC FIELD IN VACUO

1. The electromagnetic tensor F_{rs}	317
2. Lorentz transformations of the electric and magnetic 3-vectors	320
3. The energy tensor	322
4. Eigen values and principal directions for the electromagnetic energy tensor	325
5. The canonical forms for an electromagnetic field at an event	331
6. Eigen properties of the tensors F_{rs} and F_{rs}^*	336
7. The tensors F_{rs} and F_{rs}^* expressed in terms of invariants and principal null vectors	339
8. The 4-potential	345
9. Plane electromagnetic waves	350
10. Some special systems of plane waves	354
11. Reduction of a pair of sinusoidal plane wave systems. Interference	356
12. Some scalar wave functions	359
13. Generation of a Maxwellian field from a scalar wave function	363
14. An electromagnetic model of a material particle	366
15. Superposition of elementary wave functions	372
16. A nearly static electromagnetic particle (β large)	374
17. Model of a photon with $\beta = 0$	375
18. Model of a photon with β small	379
19. Null 3-spaces and Green's theorem	383
20. Electromagnetic shock waves	385

CHAPTER X. FIELDS AND CHARGES

1. The discrete and continuous methods	387
2. The Coulomb field of an electric charge	388
3. The field of an accelerated charge	391
4. The ponderomotive force	394
5. The electromagnetic Kepler problem	396

6. Radiation of energy and third-order equations of motion	399
7. Maxwell's equations with current	403
8. Explicit formula for the 4-potential	405
9. The energy tensor of a field with current	410
10. Maxwell's equations derived from a variational principle	413
11. Maxwell's equations in moving matter	415

APPENDIX

A. 3-waves and 2-waves	419
B. Radiation of energy from an accelerated charge . . .	422
C. Scattering and capture by a fixed nucleus	426
D. The absolute 2-content of a 3-cell on a null cone . . .	430
E. Calculations for retarded potential	432
References	435
Index	439
