Contents

1. *Introduction*. By H.P. Baltes 1
   1.1 Direct and Inverse Problems in Optical Physics 1
   1.2 Role of Prior Knowledge 3
   1.3 Survey of Specific Inverse Problems 4
   1.4 Notation in Coherence Theory 8
   References 10

2. *The Phase Reconstruction Problem for Wave Amplitudes and Coherence Functions*. By H.A. Ferwerda (With 3 Figures) 13
   2.1 Phase Reconstruction for Wave Amplitudes 14
      2.1.1 Relevance of the Phase Problem for Object Structure Determination 14
      2.1.2 Derivation of the Basic Equations Governing the Phase Problem 15
      2.1.3 General Considerations on the Phase Problem 16
      2.1.4 Greenaway's Proposal for Phase Recovery from a Single Intensity Distribution 19
      2.1.5 The Method of Half-Plane Apertures for Semi-Weak Objects 20
      2.1.6 The Logarithmic Hilbert Transform: Methods for Circumventing Complications Due to Zeros 22
      2.1.7 Phase Retrieval for Strong Objects from Two Defocused Images 24
      2.1.8 Phase Retrieval from the Intensity Distributions in Exit Pupil and Image Plane 28
      2.1.9 Phase Retrieval from Two Defocused Images for Semi-Weak Objects 30
   2.2 Phase Reconstruction for Coherence Functions 33
      2.2.1 Phase Determination of Optical Coherence Functions 33
      2.2.2 Determination of the Phase of the Spatial Coherence Function with an Incoherent Reference Point Source 34
      2.2.3 Determination of the Phase of the Spatial Coherence Function with an Exponential Filter 36

2.2.4 Determination of the Phase of the Spatial Coherence Function from the Intensity in the Fraunhofer Plane 37
References 38

3. *The Uniqueness of Inverse Problems.* By B.J. Hoenders (With 2 Figures) ... 41
3.1 Summary of Inverse Problems 41
3.1.1 Inverse Sturm-Liouville Problems 41
3.1.2 Reconstruction Problems 42
3.1.3 Three-Dimensional Reconstruction from Projections 43
3.2 Inverse Diffraction 44
3.2.1 Inverse Diffraction from Far-Field Data 44
3.2.2 Inverse Diffraction from Spherical Surface to Spherical Surface 49
3.2.3 Inverse Diffraction from Plane to Plane 51
3.2.4 Generalization to Arbitrary Surfaces 52
3.2.5 The Determination of the Shape of a Scatterer from Far-Field Data 53
3.3 Non-Radiating Sources 58
3.3.1 Early Results and Special Cases 59
3.3.2 General Theory 61
3.3.3 Integral Equations and Uniqueness by Prior Knowledge 66
3.4 The Determination of an Object from Scattering Data 68
3.4.1 Examples of Nonuniqueness 70
3.4.2 Phase Shift Analysis and the Reconstruction of a Potential .. 74
3.4.3 The Determination of a Potential or Index of Refraction from the Scattered Fields Generated by a Set of Monochromatic Plane Waves 75
3.4.4 The Unique Determination of an Object from Scattering Data .. 77
3.4.5 The Analytical Continuation of the Electromagnetic Field from the Exterior to the Interior of a Scatterer and Its Physical Implications 78
References 80

4. *Spatial Resolution of Subwavelength Sources from Optical Far-Zone Data* By H.G. Schmidt-Weinmar (With 17 Figures) 83
4.1 Approaches to Superresolution 84
4.1.1 Array of Sources with Known Radiation Pattern 85
4.1.2 Superresolution Using Evanescent Waves 86
4.1.3 λ-Localized Sources 86
4.2 Partial Waves Associated with Complex Spatial Frequencies 86
4.3 Representations and Expansions of the EM Field 91

4.3.1 Integral Representations 91
4.3.2 Partial-Wave Representation of Exterior Field 94
4.3.3 Multipole Waves 94
4.3.4 Plane Waves 97
4.4 Band-Limiting at Variance with λ-Localized Sources 100
4.5 High-Frequency Information in the Far Zone Given a λ-Localized Source 106
4.6 λ-Localized Sources Reconstructed from Far-Zone Data 107
4.7 Measurement of Phase and Magnitude of the Optical Radiation Pattern 112
4.8 Discussion 115
References 116

5. *Radiometry and Coherence*
By H.P. Baltes, J. Geist, and A. Walther (With 4 Figures) 119
5.1 The Development of Radiometry 120
5.1.1 The Classical Period 120
5.1.2 The Baroque Period 121
5.1.3 The Modern Period 122
5.2 Coherence of Blackbody Radiation 123
5.2.1 Temporal Coherence 124
5.2.2 Spatial Coherence 126
5.3 First-Order Radiometry 127
5.3.1 Energy Flow in Scalar Fields 127
5.3.2 Coherence Theory and the Radiometric Quantities 129
5.3.3 The Van Cittert-Zernike Theorem 133
5.3.4 An Example: Quasistationary Sources 135
5.4 Radiant Intensity and Angular Coherence 137
5.4.1 Source Models 138
5.4.2 Inverse Relations 139
5.4.3 Bessel-Correlated Sources 143
5.4.4 Gauss-Correlated Sources 144
5.4.5 An Application: Coherence of Thermionic Sources 145
5.5 Radiation Efficiency 146
5.5.1 Radiance of Model Sources 146
5.5.2 Emittance and Radiation Efficiency 147
5.5.3 Examples 147
5.6 Second-Order Radiometry 148
5.6.1 Radiant Intensity Fluctuation and Autocorrelation 148
5.6.2 Second-Order Radiometric Quantities 149
5.6.3 An Example: Gauss-Correlated Chaotic Source 150
References 150

6. *Statistical Features of Phase Screens from Scattering Data*
By A. Zardecki (With 6 Figures) 155
6.1 Basic Formulation of the Statistical Problem 156
6.1.1 Physical Models 157
6.1.2 Characteristic Functional of the Scattered Light 160
6.1.3 Correlation Functions 162
6.1.4 Gaussian Limit 164
6.2 More General Detection and Coherence Conditions 165
6.2.1 Gaussian Scattered Field 165
6.2.2 Polychromatic Speckle Patterns 170
6.3 Amplitude and Intensity Correlations 171
6.3.1 Information Contained in Amplitude Correlations 171
6.3.2 Information Contained in Intensity Correlations 173
6.3.3 Moving Diffusers 176
6.4 Number-Dependent Effects 178
6.4.1 Moments and Probability Distribution of Intensity 178
6.4.2 Examples 180
6.4.3 Applications 183
6.5 Concluding Remarks 184
