PREFACE	v
HISTORICAL INTRODUCTION	xix
I. BASIC PROPERTIES OF THE ELECTROMAGNETIC FIELD	1
1.1. The Electromagnetic Field	1
1.1.1. Maxwell's equations	1
1.1.2. Material equations	2
1.1.3. Boundary conditions at a surface of discontinuity	3
1.1.4. The energy law of the electromagnetic field	6
1.2. The Wave Equation and the Velocity of Light	10
1.3. Scalar Waves	13
1.3.1. Plane waves	14
1.3.2. Spherical waves	15
1.3.3. Harmonic waves. The phase velocity	15
1.3.4. Wave packets. The group velocity	18
1.4. Vector Waves	22
1.4.1. The general electromagnetic plane wave	22
1.4.2. The harmonic electromagnetic plane wave	24
(a) Elliptic polarization	24
(b) Linear and circular polarization	28
(c) Characterization of the state of polarization by Stokes parameters	29
1.4.3. Harmonic vector waves of arbitrary form	31
1.5. Reflection and Refraction of a Plane Wave	36
1.5.1. The laws of reflection and refraction	36
1.5.2. Fresnel formulae	38
1.5.3. The reflectivity and transmissivity; polarization on reflection and refraction	40
1.5.4. Total reflection	46
1.6. Wave Propagation in a Stratified Medium. Theory of Dielectric Films	50
1.6.1. The basic differential equations	51
1.6.2. The characteristic matrix of a stratified medium	54
(a) A homogeneous dielectric film	57
(b) A stratified medium as a pile of thin homogeneous films	58
1.6.3. The reflection and transmission coefficients	59
1.6.4. A homogeneous dielectric film	60
1.6.5. Periodically stratified media	65
II. ELECTROMAGNETIC POTENTIALS AND POLARIZATION	70
2.1. The Electrodynamic Potentials in the Vacuum	71
2.1.1. The vector and scalar potentials	71
2.1.2. Retarded potentials	73

	PAGE
2.2. Polarization and Magnetization	75
2.2.1. The potentials in terms of polarization and magnetization	75
2.2.2. Hertz vectors	78
2.2.3. The field of a linear electric dipole	80
2.3. The Lorentz-Lorenz Formula and Elementary Dispersion Theory	83
2.3.1. The dielectric and magnetic susceptibilities	83
2.3.2. The effective field	84
2.3.3. The mean polarizability: the Lorentz-Lorenz formula	86
2.3.4. Elementary theory of dispersion	89
2.4. Propagation of Electromagnetic Waves Treated by Integral Equations	97
2.4.1. The basic integral equation	98
2.4.2. The Ewald-Oseen extinction theorem and a rigorous derivation of the Lorentz-Lorenz formula	99
2.4.3. Refraction and reflection of a plane wave, treated with the help of the Ewald-Oseen extinction theorem	103
 III. FOUNDATIONS OF GEOMETRICAL OPTICS	 108
3.1. Approximation for Very Short Wavelengths	108
3.1.1. Derivation of the eikonal equation	109
3.1.2. The light rays and the intensity law of geometrical optics	112
3.1.3. Propagation of the amplitude vectors	116
3.1.4. Generalizations and the limits of validity of geometrical optics	118
3.2. General Properties of Rays	120
3.2.1. The differential equation of light rays	120
3.2.2. The laws of refraction and reflection	123
3.2.3. Ray congruences and their focal properties	125
3.3. Other Basic Theorems of Geometrical Optics	126
3.3.1. Lagrange's integral invariant	126
3.3.2. The principle of Fermat	127
3.3.3. The theorem of Malus and Dupin and some related theorems	129
 IV. GEOMETRICAL THEORY OF OPTICAL IMAGING	 132
4.1. The Characteristic Functions of Hamilton	132
4.1.1. The point characteristic	132
4.1.2. The mixed characteristic	134
4.1.3. The angle characteristic	136
4.1.4. Approximate form of the angle characteristic of a refracting surface of revolution	137
4.1.5. Approximate form of the angle characteristic of a reflecting surface of revolution	140
4.2. Perfect Imaging	142
4.2.1. General theorems	142
4.2.2. Maxwell's "fish-eye"	146
4.2.3. Stigmatic imaging of surfaces	148

	PAGE
4.3. Projective Transformation (Collineation) with Axial Symmetry	149
4.3.1. General formulae	150
4.3.2. The telescopic case	153
4.3.3. Classification of projective transformations	153
4.3.4. Combination of projective transformations	154
4.4. Gaussian Optics	156
4.4.1. Refracting surface of revolution	156
4.4.2. Reflecting surface of revolution	159
4.4.3. The thick lens	160
4.4.4. The thin lens	162
4.4.5. The general centred system	163
4.5. Stigmatic Imaging with Wide-angle Pencils	165
4.5.1. The sine condition	166
4.5.2. The Herschel condition	168
4.6. Astigmatic Pencils of Rays	168
4.6.1. Focal properties of a thin pencil	168
4.6.2. Refraction of a thin pencil	170
4.7. Chromatic Aberration. Dispersion by a Prism	173
4.7.1. Chromatic aberration	173
4.7.2. Dispersion by a prism	176
4.8. Photometry and Apertures	180
4.8.1. Basic concepts of photometry	180
4.8.2. Stops and pupils	185
4.8.3. Brightness and illumination of images	187
4.9. Ray Tracing	189
4.9.1. Oblique meridional rays	189
4.9.2. Paraxial rays	192
4.9.3. Skew rays	193
4.10. Design of Aspheric Surfaces	196
4.10.1. Attainment of axial stigmatism	196
4.10.2. Attainment of aplanatism	199
V. GEOMETRICAL THEORY OF ABERRATIONS	202
5.1. Wave and Ray Aberrations; the Aberration Function	202
5.2. The Perturbation Eikonal of Schwarzschild	206
5.3. The Primary (Seidel) Aberrations	210
5.4. Addition Theorem for the Primary Aberrations	217
5.5. The Primary Aberration Coefficients of a General Centred Lens System	219
5.5.1. The Seidel formulae in terms of two paraxial rays	219
5.5.2. The Seidel formulae in terms of one paraxial ray	223
5.5.3. Petzval's theorem	224
5.6. Example: The Primary Aberrations of a Thin Lens	225
5.7. The Chromatic Aberration of a General Centred Lens System	229

	PAGE
VI. IMAGE-FORMING INSTRUMENTS	232
6.1. The Eye	232
6.2. The Camera	234
6.3. The Refracting Telescope	238
6.4. The Reflecting Telescope	244
6.5. Instruments of Illumination	249
6.6. The Microscope	250
VII. ELEMENTS OF THE THEORY OF INTERFERENCE AND INTERFEROMETERS	255
7.1. Introduction	255
7.2. Interference of Two Monochromatic Waves	256
7.3. Two-beam Interference: Division of Wave-front	259
7.3.1. Young's experiment	259
7.3.2. Fresnel's mirrors and similar arrangements	260
7.3.3. Fringes with quasi-monochromatic and white light	263
7.3.4. Use of slit sources; visibility of fringes	264
7.3.5. Application to the measurement of optical path difference: the Rayleigh interferometer	267
7.3.6. Application to the measurement of angular dimensions of sources: the Michelson stellar interferometer	270
7.4. Standing Waves	276
7.5. Two-beam Interference: Division of Amplitude	280
7.5.1. Fringes with a plane parallel plate	280
7.5.2. Fringes with thin films; the Fizeau interferometer	285
7.5.3. Localization of fringes	290
7.5.4. The Michelson interferometer	299
7.5.5. The Twyman-Green and related interferometers	301
7.5.6. Fringes with two identical plates: the Jamin interferometer and interference microscopes	305
7.5.7. The Mach-Zehnder interferometer; the Bates wave-front shearing interferometer	311
7.5.8. The coherence length; the application of two-beam interference to the study of the fine structure of spectral lines	315
7.6. Multiple-beam Interference	322
7.6.1. Multiple-beam fringes with a plane parallel plate	322
7.6.2. The Fabry-Perot interferometer	328
7.6.3. The application of the Fabry-Perot interferometer to the study of the fine structure of spectral lines	332
7.6.4. The application of the Fabry-Perot interferometer to the comparison of wavelengths	337
7.6.5. The Lummer-Gehreke interferometer	340
7.6.6. Interference filters	346
7.6.7. Multiple-beam fringes with thin films	350

	PAGE
7.6.8. Multiple-beam fringes with two plane parallel plates	359
(a) Fringes with monochromatic and quasi-monochromatic light	359
(b) Fringes of superposition	363
7.7. The Comparison of Wavelengths with the Standard Metre	366
<b>VIII. ELEMENTS OF THE THEORY OF DIFFRACTION</b>	<b>369</b>
8.1. Introduction	369
8.2. The Huygens-Fresnel Principle	369
8.3. Kirchhoff's Diffraction Theory	374
8.3.1. The integral theorem of Kirchhoff	374
8.3.2. Kirchhoff's diffraction theory	377
8.3.3. Fraunhofer and Fresnel diffraction	381
8.4. Transition to a Scalar Theory	386
8.4.1. The image field due to a monochromatic oscillator	386
8.4.2. The total image field	389
8.5. Fraunhofer Diffraction at Apertures of Various Forms	391
8.5.1. The rectangular aperture and the slit	392
8.5.2. The circular aperture	394
8.5.3. Other forms of aperture	397
8.6. Fraunhofer Diffraction in Optical Instruments	400
8.6.1. Diffraction gratings	400
(a) The principle of the diffraction grating	400
(b) Types of grating	406
(c) Grating spectrographs	411
8.6.2. Resolving power of image-forming systems	413
8.6.3. Image formation in the microscope	417
(a) Incoherent illumination	417
(b) Coherent illumination—Abbe's theory	418
(c) Coherent illumination—Zernike's phase contrast method of observation	423
8.7. Fresnel Diffraction at a Straight Edge	427
8.7.1. The diffraction integral	427
8.7.2. Fresnel's integrals	429
8.7.3. Fresnel diffraction at a straight edge	432
8.8. The Three-dimensional Light Distribution near Focus	434
8.8.1. Evaluation of the diffraction integral in terms of Lommel functions	434
8.8.2. The distribution of intensity	438
(a) Intensity in the geometrical focal plane	440
(b) Intensity along the boundary of the geometrical shadow	440
(c) Intensity along the axis	440
8.8.3. The integrated intensity	441
8.8.4. The phase behaviour	444
8.9. The Boundary Diffraction Wave	448

	PAGE
8.10. Gabor's Method of Imaging by Reconstructed Wave-fronts	452
8.10.1. Producing the positive hologram	452
8.10.2. The reconstruction	454
IX. THE DIFFRACTION THEORY OF ABERRATIONS	458
9.1. The Diffraction Integral in the Presence of Aberrations	459
9.1.1. The diffraction integral	459
9.1.2. The displacement theorem. Change of reference sphere	461
9.1.3. A relation between the intensity and the average deformation of wave-fronts	462
9.2. Expansion of the Aberration Function	463
9.2.1. The circle polynomials of Zernike	463
9.2.2. Expansion of the aberration function	465
9.3. Tolerance Conditions for Primary Aberrations	467
9.4. The Diffraction Pattern Associated with a Single Aberration	472
9.4.1. Primary spherical aberration	474
9.4.2. Primary coma	476
9.4.3. Primary astigmatism	478
9.5. Imaging of Extended Objects	479
9.5.1. Coherent illumination	480
9.5.2. Incoherent illumination	483
X. INTERFERENCE AND DIFFRACTION WITH PARTIALLY COHERENT LIGHT	490
10.1. Introduction	490
10.2. A Complex Representation of Real Polychromatic Fields	492
10.3. The Correlation Functions of Light Beams	497
10.3.1. Interference of two partially coherent beams. The mutual coherence function and the complex degree of coherence	497
10.3.2. Spectral representation of mutual coherence	500
10.4. Interference and Diffraction with Quasi-monochromatic Light	502
10.4.1. Interference with quasi-monochromatic light. The mutual intensity	502
10.4.2. Calculation of mutual intensity and degree of coherence for light from an extended incoherent quasi-monochromatic source	505
(a) The Van Cittert-Zernike theorem	505
(b) Hopkins' formula	510
10.4.3. An example	511
10.4.4. Propagation of mutual intensity	513

	PAGE
10.5. Some Applications	515
10.5.1. The degree of coherence in the image of an extended incoherent quasi-monochromatic source	515
10.5.2. The influence of the condenser on resolution in a microscope	519
(a) Critical illumination	519
(b) Köhler's illumination	521
10.5.3. Imaging with partially coherent quasi-monochromatic illumination	523
(a) Transmission of mutual intensity through an optical system	523
(b) Images of transilluminated objects	526
10.6. Some Theorems Relating to Mutual Coherence	529
10.6.1. Calculation of mutual coherence for light from an incoherent source	529
10.6.2. Propagation of mutual coherence	531
10.7. Rigorous Theory of Partial Coherence	532
10.7.1. Wave equations for mutual coherence	532
10.7.2. Rigorous formulation of the propagation law for mutual coherence	534
10.7.3. The coherence time and the effective spectral width	537
10.8. Polarization Properties of Quasi-monochromatic Light	541
10.8.1. The coherency matrix of a quasi-monochromatic plane wave	541
(a) Natural light	545
(b) Monochromatic light	546
10.8.2. Some equivalent representations. The degree of polarization of a light wave	547
10.8.3. The Stokes parameters of a quasi-monochromatic plane wave	550
 XI. RIGOROUS DIFFRACTION THEORY	 553
11.1. Introduction	553
11.2. Boundary Conditions and Surface Currents	554
11.3. Diffraction by a Plane Screen: Electromagnetic Form of Babinet's Principle	556
11.4. Two-dimensional Diffraction by a Plane Screen	557
11.4.1. The scalar nature of two-dimensional electromagnetic fields	557
11.4.2. An angular spectrum of plane waves	558
11.4.3. Formulation in terms of dual integral equations	561
11.5. Two-dimensional Diffraction of a Plane Wave by a Half-plane	562
11.5.1. Solution of the dual integral equations for $E$ -polarization	562
11.5.2. Expression of the solution in terms of Fresnel integrals	564
11.5.3. The nature of the solution	567
11.5.4. The solution for $H$ -polarization	571
11.5.5. Some numerical calculations	572
11.5.6. Comparison with approximate theory and with experimental results	574

	PAGE
11.6. Three-dimensional Diffraction of a Plane Wave by a Half-plane	575
11.7. Diffraction of a Localized Source by a Half-plane	577
11.7.1. A line-current parallel to the diffracting edge	577
11.7.2. A dipole	581
11.8. Other Problems	584
11.8.1. Two parallel half-planes	584
11.8.2. An infinite stack of parallel, staggered half-planes	586
11.8.3. A strip	586
11.8.4. Further problems	588
11.9. Uniqueness of Solution	588
XII. DIFFRACTION OF LIGHT BY ULTRASONIC WAVES	590
12.1. Qualitative Description of the Phenomenon and Summary of Theories Based on Maxwell's Differential Equations	590
12.1.1. Qualitative description of the phenomenon	590
12.1.2. Summary of theories based on Maxwell's equations	593
12.2. Diffraction of Light by Ultrasonic Waves as Treated by the Integral Equation Method	596
12.2.1. Integral equation for $E$ -polarization	597
12.2.2. The trial solution of the integral equation	598
12.2.3. Expressions for the amplitudes of the light waves in the diffracted and reflected spectra	600
12.2.4. Solution of the equations by a method of successive approximations	601
12.2.5. Expressions for the intensities of the first and second order lines for some special cases	604
12.2.6. Some qualitative results	605
12.2.7. The Raman and Nath approximation	606
XIII. OPTICS OF METALS	608
13.1. Wave Propagation in a Conductor	608
13.2. Refraction and Reflection at a Metal Surface	612
13.3. Elementary Electron Theory of the Optical Constants of Metals	621
13.4. Wave Propagation in a Stratified Conducting Medium. Theory of Metallic Films	624
13.4.1. An absorbing film on a transparent substrate	624
13.4.2. A transparent film on an absorbing substrate	629
13.5. Diffraction by a Conducting Sphere; Theory of Mie	630
13.5.1. Mathematical solution of the problem	631
(a) Representation of the field in terms of Debye's potentials	631
(b) Series expansions for the field components	636
(c) Summary of formulae relating to the spherical harmonics and to the cylindrical functions	642

	PAGE
13.5.2. Some consequences of Mie's formulae	644
(a) The partial waves	644
(b) Limiting cases	646
(c) Intensity and polarization of the scattered light	649
13.5.3. Total scattering and extinction	653
(a) Some general considerations	653
(b) Computational results	658
XIV. OPTICS OF CRYSTALS	662
14.1. The Dielectric Tensor of an Anisotropic Medium	662
14.2. The Structure of a Monochromatic Plane Wave in an Anisotropic Medium	664
14.2.1. The phase velocity and the ray velocity	664
14.2.2. Fresnel's formulae for the propagation of light in crystals	667
14.2.3. Geometrical constructions for determining the velocities of propagation and the directions of vibrations	670
(a) The ellipsoid of wave normals	670
(b) The ray ellipsoid	673
(c) The normal surface and the ray surface	673
14.3. Optical Properties of Uniaxial and Biaxial Crystals	675
14.3.1. The optical classification of crystals	675
14.3.2. Light propagation in uniaxial crystals	676
14.3.3. Light propagation in biaxial crystals	678
14.3.4. Refraction in crystals	681
(a) Double refraction	681
(b) Conical refraction	683
14.4. Measurements in Crystal Optics	687
14.4.1. The Nicol prism	687
14.4.2. Compensators	688
(a) The quarter-wave plate	688
(b) Babinet's compensator	689
(c) Soleil's compensator	691
(d) Berek's compensator	691
14.4.3. Interference with crystal plates	691
14.4.4. Interference figures from uniaxial crystal plates	695
14.4.5. Interference figures from biaxial crystal plates	698
14.4.6. Location of optic axes and determination of the principal refractive indices of a crystalline medium	699
14.5. Stress Birefringence and Form Birefringence	700
14.5.1. Stress birefringence	700
14.5.2. Form birefringence	702
14.6. Absorbing Crystals	705
14.6.1. Light propagation in an absorbing anisotropic medium	705
14.6.2. Interference figures from absorbing crystal plates	710
(a) Uniaxial crystals	711
(b) Biaxial crystals	712
14.6.3. Dichroic polarizers	713

	PAGE
APPENDICES	716
I. <i>The Calculus of Variations</i>	716
1. Euler's equations as necessary conditions for an extremum	716
2. Hilbert's independence integral and the Hamilton-Jacobi equation	717
3. The field of extremals	719
4. Determination of all extremals from the solution of the Hamilton-Jacobi equation	721
5. Hamilton's canonical equations	722
6. The special case when the independent variable does not appear explicitly in the integrand	723
7. Discontinuities	724
8. Weierstrass' and Legendre's conditions (sufficiency conditions for an extremum)	726
9. Minimum of the variational integral when one end point is constrained to a surface	728
10. Jacobi's criterion for a minimum	728
