

Contents

Chapter 1. Introduction

1.1. The Optical Transmission System	1
1.2. Source Fields	5
1.2.1. Point Sources	6
1.2.2. Extended Sources	9
1.2.2.1. The Traditional Radiometry	9
1.2.2.2. The Radiant Emittance and Irradiance	10
1.2.2.3. The Traditional Radiance	11
1.2.2.4. The Traditional Radiant Intensity	12
1.2.2.5. The Lambertian Source	13
1.3. Power Collected by a Receiver	13
1.4. Noise Sources	14
1.4.1. Blackbody Radiation	16
1.4.2. Solar Irradiance	20
1.4.3. Daytime Sky Radiance	23
1.4.4. Nighttime Sky Radiance	23
1.4.5. Earthshine Radiance	26
References	26

Chapter 2. Coherence Theory and Random Channels

2.1. Field Properties	29
2.2. The Mutual Coherence Function	32
2.3. The Narrowband Approximation	35
2.4. Coherence Separability	37
2.5. Partially Coherent and Incoherent Spatial Fields	38
2.6. System Coherence	41
2.7. Linear Channels	42
2.8. Receiver Optics	47
2.9. Clutter	51
2.10. Summary	54
References	54

Chapter 3. Optical Receivers

3.1. The Direct Detection Receiver	55
3.2. The Heterodyne (Photomixing) Receiver	66
3.3. Signal-to-Noise Ratio in Optical Receivers	70
3.4. The Free-Space Optical Channel	77
3.5. Counting Statistics	79
3.6. Binary Digital Performance	84
3.6.1. Shot Noise Limited, Ideal Gain	85
3.6.2. Shot Noise Limited, APD Gain	86
3.6.3. Thermal Noise-Limited Receivers, APD Gain	87
3.7. Block-Coded Performance	92
3.7.1. Multilevel Pulse Amplitude Modulation (MPAM)	93
3.7.2. Multislot Pulse-Position Modulation (MPPM)	95
3.8. Digital Signaling with Heterodyne Detection	97
References	99

Chapter 4. The Fiber Optic Channel

4.1. The Optical Fiber	101
4.2. Attenuation and Dispersion in Fibers	108
4.3. Dispersion and Pulse Shaping in Fibers Undergoing Diffusion	112
4.4. Pulse Stretching in Multimode Fibers	116
4.5. Communications Link Models for the Fiber Channel	117
4.6. Digital Transmission in Fiber Channels	121
4.7. Designing Fiber Systems	127
References	129

Chapter 5. The Turbulence Channel

5.1. Atmospheric Turbulence	132
5.1.1. Atmospheric Turbulence Models	132
5.1.2. The Atmospheric Scattering Cross Section	137
5.1.3. Models for the Wavenumber Spectrum Structure Parameter	141
5.2. Optical Propagation through Turbulence	144
5.2.1. The Rytov Method	146
5.2.2. The Spectrum of Log-Amplitude and Phase Fluctuations	148
5.2.3. The Log-Amplitude, Phase, and Wave Structure Functions	150
5.2.4. Spatial Coherence	151
5.2.4.1. Spatial Coherence in Weak Turbulence	152
5.2.4.2. Spatial Coherence in Strong Turbulence	154
5.2.5. Optical Heterodyne Detection in Atmospheric Turbulence	173
5.2.6. Scintillation	174
5.2.6.1. Log-Amplitude and Phase Fluctuations for Kolmogorov Turbulence	176
5.2.6.2. Scintillation Statistics	178
5.2.6.3. Aperture Averaging of Scintillation	182
5.2.7. Angle-of-Arrival Fluctuations	188
5.2.8. Beam Spreading	191

5.3. Optical Propagation in Marine Turbulence	197
5.3.1. $\Phi_n(k)$ for Marine Turbulence	198
5.3.2. The Scattered Radiance	201
5.4. An Example—Multimode Heterodyne Detection	204
References	208

Chapter 6. The Optical Scatter Channel and Its Properties

6.1. Mie Scattering Theory	212
6.2. General Characteristics of the Atmosphere	221
6.2.1. Atmospheric Haze	224
6.2.2. Atmospheric Fogs	233
6.2.3. Atmospheric Clouds	233
6.2.4. Atmospheric Rain	237
6.3. General Characteristics of the Ocean	238
6.4. The Apparent Properties of the Sea	249
6.4.1. Reflectance	254
6.4.2. Irradiance Attenuation Coefficients	257
6.4.3. Secchi Disk	265
References	270

Chapter 7. Mathematical Models for Energy Propagation in the Optical Scatter Channel

7.1. The Mutual Coherence Function for Multiple-Forward-Scatter Media	274
7.1.1. The MCF Model	274
7.1.2. Discussion of the Particulate MCF and Its Approximate Forms	276
7.2. Radiation Transport in Atmospheric and Marine Environments	278
7.2.1. The Theory of Radiative Transfer in Mie Scattering Media	280
7.2.2. Multiple-Forward-Scatter Characterizations Using the Small-Angle Scattering Approximation	284
7.2.2.1. A First-Order Solution for Multiple Forward-Scattered Irradiance	284
7.2.2.2. Over-the-Horizon Propagation from Multiple Forward Scatter	289
7.2.2.3. The Green's Function for Multiple Scattering	293
7.2.2.4. The Arnush-Fante Multiple-Forward-Scattering Approximations	297
7.2.2.5. Other Mathematical Approaches	311
7.2.2.6. Monte Carlo Simulation	322
7.3. The Air/Sea Interface	337
7.3.1. Geometrical Optics Approach to Channel Coupling	338
7.3.2. Irradiance Transmittance through the Air/Sea Interface	343
7.3.2.1. Light Transmittance through Sea Foam	346
7.3.3. A Green's Function Approach to Air/Sea Interface Radiance Coupling	347
7.4. System Considerations for the Optical Scatter Channel	350
7.4.1. Modulation Format Selection	351

7.4.2. Noise Considerations	354
7.4.3. Signal-to-Noise Ratio and Bit Error Probability	356
7.4.4. Link Losses	357
7.4.5. System Design	360
References	363
Appendix A. Generalized Radiometry	369
A.1. The Generalized Radiance	370
A.2. The Mutual Radiance	372
A.3. The Generalized Radiant Emittance	375
A.4. The Generalized Radiant Intensity	376
References	376
Appendix B. Transport Theory	377
B.1. Heuristic Derivation of the Radiative Transport Equation	377
B.2. Radiative Transfer Theory in the Small-Angle Scattering Limit	379
B.3. Derivation of the Small-Angle Transport Equation from Parabolic Wave Optics Theory	382
Appendix C. Solution of the Small-Angle Transport Equation for the Generalized Radiance and the Mutual Coherence Function	385
Appendix D. Power Flow in Fibers	387
Appendix E. Optical and Physical Thickness Relations for Clouds at Various Locations on the Earth	393
Appendix F. Atmospheric Optical Loss Model	397
Index	401
