Chapter 1. Analog radar signal design and digital signal processing —a Heisenberg nilpotent Lie group approach

by WALTER SCHEMPP

1.1	Introductory discussion of radar principles	2
1.2	Analog radar signal design	5
1.3	The radar synthesis problem	8
1.4	The radar invariant problem	13
1.5	The compact Heisenberg nilmanifold	15
1.6	A geometric approach to cardinal spline interpolation	20
1.7	Finite phase space and finite Fourier transform	22
1.8	The phase discontinuity of Fourier optics	23
1.9	Conclusions	24
	References	25

Chapter 2. Fourier optics from the perspective of the Heisenberg group

by HANS RASZILLIER and WALTER SCHEMPP

2.1	Introduction	29
2.2	The quantization problem	30
2.3	The Heisenberg group	31
2.4	Description of the wave field	35
2.5	Examples from quantum mechanics	36
2.6	The phase space of geometrical optics	37
2.7	Peculiarities of geometrical optics	39
2.8	Phase discontinuities	40
2.9	Systems with symmetry	41
2.10	Summary and comments	42
	References	42

Chapter 3. Lie series, Lie transformations, and their applications

by STANLY STEINBERG

3.1	Introduction	45
3.1.1	Applications of Lie series	45
3.1.2	The contents of this chapter	46
3.1.3	Review of basic concepts	47
3.2	Hamiltonian systems	48
3.2.1	The Hamilton equations of motion	48
3.2.2	Example: the harmonic oscillator	48
3.2.3	Poisson brackets	49
3.2.4	Lie derivatives	50
3.2.5	Lie series	50
3.3	Lie transformations	51
3.3.1	Properties of the Poisson bracket	52
3.3.2	Properties of Lie derivatives	52
3.3.3	Lie transformations	53
3.3.4	Example: the harmonic oscillator	53
3.3.5	Properties of Lie transformations	54
3.4	Exponential Identities	56
3.4.1	Commutators	56
3.4.2	Properties of the commutator	56
3.4.3	Exponentials and their identities	57
3.4.4	Differentiation of exponential series	58
3.4.5	Adjoint operator action	60
3.4.6	Properties of exponentials of adjoint operators	61
3.4.7	Baker–Campbell–Hausdorff formulas	62
3.4.8	The MACSYMA Programs	67
3.5	Factored Products	69
3.5.1	Similarity for Lie transformations	70
3.5.2	Degree of homogeneity	72
3.5.3	Factored product expansions	74
3.5.4	Inverse factored product expansions	76
3.5.5	Products of Lie transformations	77
3.5.6	Iterates of factored maps	79
3.6	Canonical Forms	79
3.6.1	Canonical transformations	79
3.6.2	Simplification of the Hamiltonian	80
3.6.3	The perturbation equation	81
3.7	Quadratic Hamiltonians and Integrals	85
3.7.1	Quadratic Hamiltonians	85
3.7.1.1	Nilpotent operators	85
3.7.2	Eigenvalues of quadratic operators	86
3.7.3	Eigenbases on X_k	87
3.7.4	Perturbation examples	89
3.7.4.1	The cubic potential	89
3.7.4.2	Mirror machine model	90
3.7.5	VAXIMA (MACSYMA) Programs for Lie Series	91
References	95
	General hamiltonian Lie techniques	96
	General non-hamiltonian Lie techniques	96
	Baker–Campbell–Hausdorff relations	97
	Celestial mechanics	97
	Magnetic optics	100
	Light optics	100

Neutron transport	101
Plasma physics	101
Other applications	102
Symbol manipulation	103
Texts	103

Chapter 4. Foundations of a Lie algebraic theory of geometrical optics

by ALEX J. DRAGT, ETIENNE FOREST, and KURT BERNARDO WOLF

4.1 Introduction.	105
4.2 Optical symplectic maps	106
4.2.1 Fermat's principle.	107
4.2.2 The hamiltonian formulation	108
4.2.3 The optical transfer map	109
4.3 Some Lie algebraic tools.	109
4.3.1 Lie operators	109
4.3.2 The symplectic map factorization theorem	110
4.3.3 Three operator properties.	111
4.3.4 Axially symmetric systems and $sp(2, \mathcal{R})$	112
4.3.5 The Petzval invariant	113
4.3.6 Change of factorization order	113
4.3.7 Products of symplectic maps	114
4.4 Symplectic maps in continuous systems	115
4.4.1 Propagation in a homogeneous medium	115
4.4.2 Propagation in optical fibers	117
4.4.3 The general (q, z) -dependent case.	117
4.4.3.1 The paraxial part.	118
4.4.3.2 The aberration part	119
4.4.4 Aberration in graded-index fibers	120
4.5 Symplectic maps in discontinuous systems.	120
4.5.1 The surface map factorization theorem	121
4.5.2 The optical path length	121
4.5.3 The interface matching relations	123
4.5.4 The <i>root</i> transformation	124
4.5.5 The optical transfer map	125
4.5.6 The <i>root</i> map in homogeneous media	126
4.6 Refraction at surfaces	127
4.6.1 The root map for polynomial surfaces.	128
4.6.2 The refracting surface map	129
4.6.3 Surface tangency conditions.	132
4.6.4 The aberration polynomials.	133
4.6.4.1 The linear part of the transformation.	133
4.6.4.2 The third-order aberration polynomials.	134
4.6.4.3 The 'direct' solution	134
4.6.4.4 The solution by quadrature.	135
4.6.4.5 The Seidel third-order aberrations	136
4.7 The symplectic classification of aberrations	139
4.7.1 A three-dimensional space for axis-symmetric systems	139
4.7.2 Decomposition of aberration polynomials in multiplets	140
4.7.3 The symplectic aberration polynomials ${}^k y_m^i$	141
4.7.4 The third-order aberration algebra and group.	145
4.7.5 Applications of the symplectic multiplet decomposition	147
4.7.6 Compounding aberrations through Wigner coefficients	150
4.8 Concluding discussion	152
4.8.1 The code MARYLIE	152
4.8.2 Aberration ideals	153
4.8.3 Misaligned and misplaced optical elements	154
References.	155

Chapter 5. Canonical transforms for paraxial wave optics

by OCTAVIO CASTAÑOS, ENRIQUE LÓPEZ-MORENO, and KURT BERNARDO WOLF

5.1	Introduction and basic results.	159
5.1.1	The Heisenberg–Weyl and the real symplectic groups.	159
5.1.2	The Weyl-symplectic group Γ_N	160
5.1.3	The approach we follow	161
5.2	The group $\Gamma_N = W_N \wedge Sp(2N, \mathbb{R})$ in optics.	161
5.2.1	The phase space of geometrical optics	161
5.2.2	The canonical transform representation of Γ_N	162
5.2.3	Units, singularities, phases, and covers	162
5.2.4	Optical elements and associated operators	164
5.2.4.1	Free propagation	164
5.2.4.2	Quadratic refracting surface	164
5.3	Concatenation to optical systems	165
5.3.1	Concatenation order	165
5.3.2	Optical Fourier analyzers.	165
5.3.3	The phase anomaly.	166
5.3.4	Axis-symmetric systems	166
5.3.5	Complementarity in $Sp(2N, \mathbb{R})$	167
5.3.6	Partial wave expansions	168
5.3.7	Spots off the axis.	169
5.4	Gaussian beams and other self-reproducing wavefunctions	170
5.4.1	Simple gaussian beams	170
5.4.2	Coherent states.	171
5.4.3	Self-reproducing wavefunctions.	172
5.4.4	Pupils	173
5.5	Some further questions	175
5.5.1	The Wigner distribution and Woodward’s cross-ambiguity function	175
5.5.2	Schrödinger wavization for aberrations.	176
5.5.3	A basic euclidean algebra for optics	177
	References	180

Chapter 6. Wave theory of imaging systems

by JOHN R. KLAUDER

6.1	Rays	183
6.1.1	Gaussian ray optics.	183
6.1.2	Lie algebraic formulation	184
6.1.3	Aberrations.	184
6.1.4	Singular canonical transformations	185
6.2	Waves	186
6.2.1	Configuration representation	186
6.2.2	Integral kernels.	187
6.2.3	Coherent-state representation	188
6.2.4	Coherent-state path-integral representation.	189
	References	191

Chapter 7. Invariants and coherent states in fiber optics

by VLADIMIR I. MAN'KO

7.1 Introduction	193
7.2 The parabolic equation	194
7.3 Quantum invariants and propagator	195
7.4 Quadratic media	196
7.5 Invariants for quadratic media	196
7.6 The propagator in quadratic media	197
7.7 Coherent states, gaussian beams	198
7.8 Modes in quadratic media	199
7.9 Mode coupling coefficients and the Franck–Condon principle	200
7.10 One-dimensional quadratic media and the analogue of the Ramsauer effect	201
7.11 Concluding remarks	203
References	204

Chapter 8. The influence of spherical aberration on gaussian beam propagation

by VLADIMIR I. MAN'KO and KURT BERNARDO WOLF

8.1 Introduction	207
8.2 Gaussian beams	208
8.2.1 The fundamental gaussian mode	208
8.2.2 Coherent states	209
8.2.3 Correlated coherent states	210
8.2.4 Discrete correlated modes	212
8.3 The free propagation Hamiltonian	212
8.3.1 The Hamiltonian as a series	213
8.3.2 The equations of motion	213
8.3.3 Wavization	214
8.3.4 The evolution operator	214
8.3.5 The Green function in momentum space	215
8.4 Characteristics of gaussian beams under free propagation	215
8.4.1 The correlation functions	215
8.4.2 The generating functional	216
8.4.3 The generating function for moments	218
8.4.4 Aberrations in the moments of correlated coherent states	219
8.4.5 Aberration of the two-point correlation functions	221
8.4.6 Aberration for discrete correlated modes	222
8.5 Concluding remarks	223
References	224

Appendix A. The symplectic groups, their parametrization and cover

A.1 Rank one: $SL(2, \mathbb{R})$, $Sp(2, \mathbb{R})$, $SU(1, 1)$, $SO(2, 1)$, and $\overline{Sp(2, \mathbb{R})}$	227
A.1.1 $SL(2, \mathbb{R})$	227
A.1.2 $Sp(2, \mathbb{R})$	228
A.1.3 $SU(1, 1)$	228
A.1.4 $SO(2, 1)$	229

A.2	Connectivity	229
A.2.1	The connectivity of $SU(1,1)$	230
A.2.2	The covering group of $SU(1,1)$	231
A.2.3	The covering group $\overline{Sp}(2, \mathbb{R})$	232
A.2.4	The metaplectic group $Mp(2, \mathbb{R})$	232
A.3	Subgroups	233
A.3.1	Elliptic subgroup.	233
A.3.2	Hyperbolic subgroups	233
A.3.3	Parabolic subgroups	233
A.3.4	Conjugation and trace	234
A.4	The general case of rank N	234
A.4.1	$Sp(2N, \mathbb{R})$	234
A.4.2	The Bargmann form for $Sp(2N, \mathbb{R})$	235
A.4.3	The subgroup $U(N) \subset Sp(2N, \mathbb{R})$	236
A.4.4	The $Sp(2N, \mathbb{R})$ manifold	236
A.4.5	The Bargmann parameters for $Sp(2N, \mathbb{R})$	237
A.4.6	$\overline{Sp}(2N, \mathbb{R})$ and $Mp(2N, \mathbb{R})$	237

Appendix B. Representations of the algebra $\mathfrak{sp}(2, \mathbb{R})$

B.1	The Lie algebra $\mathfrak{sp}(2, \mathbb{R}) = \mathfrak{su}(1,1) = \mathfrak{so}(2,1)$	239
B.1.1	The cartesian basis.	239
B.1.2	Raising, lowering, and Casimir operators.	240
B.1.3	A Hilbert space and a basis	240
B.1.4	Normalization coefficients	241
B.2	The self-adjoint irreducible representations.	241
B.2.1	Bounds on multiplets	241
B.2.2	Resolution of irreducible subspaces.	243
	B.2.2.1 The continuous series $C_q^{>0}$	243
	B.2.2.2 The discrete series D_k^\pm	244
B.3	Indecomposable and finite-dimensional representations	245
B.3.1	Indecomposable representations	245
B.3.2	The finite-dimensional representations of $\mathfrak{sp}(2, \mathbb{R})$	246
B.3.3	The finite-dimensional representations of the group	247
